Record of Document Revisions

Revision	Remarks
...	Table with lifecycle information of this document see "Record of Document Revisions" (→ p. 181)
V, 11/2018	Updated warning symbols.
W, 11/2019	Added objects 2080h, 2081h, 3432h. Updated Objects 1002h, 3450h, 542C, 60B1h and FBUS.PARAM05 bits. Corrected bit 11 Statusword.
Y, 10/2020	Added objects 34D1h, 547Ah, 547Bh, edited to data type for objects 2001h and 2012h and update to "Construction of the Communication Object Identifier" (→ p. 27).

Trademarks

- AKD is a registered trademark of Kollmorgen Corporation
- SynqNet is a registered trademark of Motion Engineering Inc.
- EnDat is a registered trademark of Dr. Johannes Heidenhain GmbH
- EtherCAT is a registered trademark and patented technology, licensed by Beckhoff Automation GmbH
- Ethernet/IP is a registered trademark of ODVA, Inc.
- Ethernet/IP Communication Stack: copyright (c) 2009, Rockwell Automation
- MODBUS is a registered trademark of SCHNEIDER ELECTRIC USA, INC.
- sercos® is a registered trademark of sercos® international e.V.
- HIPERFACE is a registered trademark of Max Stegmann GmbH
- PROFINET is a registered trademark of PROFIBUS and PROFINET International (PI)
- SIMATIC is a registered trademark of SIEMENS AG
- SpeedTec is a registered trademark of TE Connectivity Industrial GmbH
- Windows is a registered trademark of Microsoft Corporation

Current patents

- US Patent 8,154,228 (Dynamic Braking For Electric Motors)
- US Patent 8,214,063 (Auto-tune of a Control System Based on Frequency Response)

Technical changes which improve the performance of the device may be made without prior notice!

2 General

2.1 About this Manual	10
2.2 Target Group	10
2.3 Symbols Used	11
2.4 Abbreviations used	12

2.1 About this Manual

This manual, *AKD CAN-Bus Communication*, describes the installation, setup, range of functions, and software protocol for the CANopen AKD product series. All AKD CANopen drives have built-in CANopen functionality; therefore, an additional option card is not required.

A digital version of this manual (pdf format) is available on the DVD included with your drive. Manual updates can be downloaded from the Kollmorgen website.

Related documents for the AKD series include:

- *AKD Installation Manual*. This manual provides instructions for installation and drive setup.
- *AKD WorkBench Online Help*. This help system describes how to use your drive in common applications. It also provides tips for maximizing your system performance with the AKD. It includes the Parameter and Command Reference Guide which provides documentation for the parameters and commands used to program the AKD.
- *Accessories Manual*. This manual provides documentation for accessories like cables and regen resistors used with AKD. Regional versions of this manual exist.

Additional documentation:

- CAN Application (CAL) for Industrial Applications (publisher CiA e.V.)
- Draft Standards 301 (from Version 4.0), 402 (publisher CiA e.V.)
- CAN Specification Version 2.0 (publisher CiA e.V.)
- ISO 11898 ... Controller Area Network (CAN) for high-speed communication

2.2 Target Group

This manual addresses personnel with the following qualifications:

- Installation: only by electrically qualified personnel.
- Setup: only by qualified personnel with extensive knowledge of electrical engineering and drive technology.
- Programming: software developers, project-planners.

The qualified personnel must know and observe the following standards:

- ISO 12100, IEC 60364 and IEC 60664
- National accident prevention regulations

2.3 Symbols Used

Symbol	Indication
 DANGER	Indicates a hazardous situation which, if not avoided, will result in death or serious injury.
 WARNING	Indicates a hazardous situation which, if not avoided, could result in death or serious injury.
 CAUTION	Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.
NOTICE	Indicates situations which, if not avoided, could result in property damage.
NOTE	This symbol indicates important notes.
	Warning of a danger (general). The type of danger is specified by the text next to the symbol.
	Warning of danger from electricity and its effects.
	Warning of danger from suspended loads.
	Warning of danger from high temperature.
	Warning of danger from automatic start.

2.4 Abbreviations used

Abbreviation	Meaning
BTB/RTO	Ready to operate (standby)
COB	Communication Object
COB-ID	Communication Object Identifier
EEPROM	Electrically erasable/programmable memory
EMC	Electromagnetic compatibility
EMCY	Emergency Objects
ISO	International Standardization Organization
km	1000 m
LED	Light-emitting diode
LSB	Low significant Byte (or Bit)
MB	Megabyte
MSB	Main significant Byte (or Bit)
NMT	Network Management Objects
NSTOP	Limit switch for negative (left) rotation
PC	Personal Computer
PDO	Process Data Object
PSTOP	Limit switch for positive (right) rotation
RAM	Volatile memory
ROD	Incremental position encoder
RXPDO	Receive PDO
SDO	Service Data Object
SYNC	Synchronization Objects
TXPDO	Transmit PDO

3 Installation and Setup

3.1 Important instructions	14
3.2 CAN-Bus Interface (X12/X13)	15
3.3 Guide to Setup	20
3.4 Important Configuration Parameters	21

3.1 Important instructions

⚠ DANGER High Voltage up to 900 V!

There is a danger of serious personal injury or death by electrical shock or electrical arcing. Capacitors can still have dangerous voltages present up to 7 minutes after switching off the supply power. Control and power connections can still be live, even if the motor is not rotating.

- Never remove electrical connections to the drive while it is live.
- To be sure, measure the voltage in the DC bus link and wait until it has fallen below 50 V.

⚠ WARNING Automatic Restart!

Automatic Restart!

Risk of death or serious injury for humans working in the machine. Drives with CAN-Bus are remote-controlled machines. They can start to move at any time without previous warning. The drive might restart automatically after power on, voltage dip or interruption of the supply voltage, depending on the parameter setting.

- Place a warning sign ("WARNING: Possible Automatic Start" or similar) to the machine.
- Ensure that power on is not possible while humans are in a dangerous zone of the machine.

NOTICE

Install the drive as described in the *Installation Manual*. The wiring for the analog setpoint input and the positioning interface, as shown in the wiring diagram in the *Installation Manual*, is not required.

NOTICE

The drive's status must be monitored by the PLC to acknowledge critical situations. Wire the FAULT contact in series into the emergency stop circuit of the installation. The emergency stop circuit must operate the supply contactor.

NOTE

It is permissible to use the setup software to alter the settings of the drive. Any other alterations will invalidate the warranty. Because of the internal representation of the position-control parameters, the position controller can only be operated if the final limit speed of the drive does not exceed:

rotary

at sinusoidal² commutation: 7500 rpm
at trapezoidal commutation: 12000 rpm.

linear

at sinusoidal² commutation: 4 m/s
at trapezoidal commutation: 6.25 m/s

NOTE

All the data on resolution, step size, positioning accuracy etc. refer to calculatory values. Non-linearities in the mechanism (backlash, flexing, etc.) are not taken into account. If the final limit speed of the motor must be altered, then all the parameters that were previously entered for position control and motion blocks must be adapted.

3.2 CAN-Bus Interface (X12/X13)

Two 6-pin RJ25 connectors X12/X13 are used for CAN-Bus connection.

Conn.	Pin	Signal	Conn.	Pin	Signal
X12	1	Internal Termination Resistor	X13	1	Internal Termination Resistor
X12	2	CAN Shield	X13	2	CAN Shield
X12	3	CANH in	X13	3	CANH out
X12	4	CANL in	X13	4	CANL out
X12	5	GND	X13	5	GND
X12	6	Internal Termination Resistor	X13	6	Internal Termination Resistor

3.2.1 CAN-Bus activation with AKD-CC models

AKD-CC drive models are Drives, which support EtherCAT and CAN fieldbus types within one common software. These CC drive models allow selecting a fieldbus support by setting the DRV.TYPE parameter to a certain value. CC drive models are delivered with EtherCAT set active.

To activate CANopen, the DRV.TYPE parameter must be changed

1. by software: connect the PC to the AKD and change the parameter DRV.TYPE in the WorkBench terminal screen (see DRV.TYPE parameter documentation) or
2. by hardware: with the rotary switches S1 & S2 at the front and the button B1 on the top side of the Drive.

The following steps are needed for changing the fieldbus type from EtherCAT to CAN with the rotary switches.

1. Set the rotary switches on the front side of the AKD to the value of 89.

2. Press the button B1 for about 3 seconds (starts DRV.NVSAVE).
Press B1 for 3 seconds.

The seven segment display shows **Cn** during the process of changing DRV.TYPE to CAN.

Do not switch off the 24[V] power supply while the seven segment shows Cn!

3. Wait until the seven segment display goes back to the original state, no the drive is prepared for CAN.
4. Power cycle the drive by switching the 24 V power supply **off** and then **on** again.

NOTE

The seven segment display shows Er (Error) in case that the DRV.TYPE instruction failed. In this case please power cycle the drive and contact the Kollmorgen customer support for further help.

3.2.2 Baud rate for CAN-Bus

The user can decide to use a fixed baud rate or an auto baud detection algorithm for the start-up behavior of the drive. The transmission rate can be set via the parameter **FBUS.PARAM01**. The parameter FBUS.PARAM01 can either be set via WorkBench or via a special mechanism with the rotary switches in the AKD front.

Baud rate [kBit/s]	FBUS.PARAM01	Upper rotary switch S1	Lower rotary switch S2
auto detect	0	9	0
125	125	9	1
250	250	9	2
500	500	9	3
1000	1000	9	4

In case of a fix baud rate, the drive sends the boot up message with the baud rate saved in the drive's non volatile memory after a power cycle. In case of auto baud detection, the drive listens for a valid CAN frame on the bus. When a valid frame is received, the drive sends the boot up message with the measured bit time. The baud rate can either be stored afterwards to non volatile memory via object 1010 sub 1, or the auto baud mechanism is used always.

For setting the baud rate with rotary switches, follow the procedure below:

1. Disable the drive.
2. Set the rotary switches to either 90 to 94 (see above table).

Set S1 to 9 and S2 to either 0 or 4

3. Push the button B1 on the AKD for at least 3 seconds until the rotary switch setting is displayed on the AKD-display.

4. When the display blinks with the set rotary switch setting stop pushing B1 and wait until the blinking stops. During that time the parameter FBUS.PARAM01 is set to the new value and all parameters are stored to the non volatile memory. The new setting will be taken with the next power-up of the drive.

If an error occurred, the following error messages will flash 5 times:

- E1 - Drive is enabled
- E2 - Non-volatile storage of the new setting failed
- E3 - Invalid rotary switch selection

3.2.3 Node Address for CAN-Bus

NOTE

After changing the node address, you must turn off the 24 V auxiliary supply for the drive and then turn it on again.

During setup, use the rotary switches on the AKD front panel to preset the station address for communication.

The rotary switches on the front of the AKD (S1&S2) correspond to the CAN node address.

The S1&S2 switches also correspond to the IP address setting of the drive. Both CAN and IP network address schemes have to be configured to account for this dependence if both TCP/IP and CAN networks are running at the same time in an application. Example:

S1 (MSB)	S2 (LSB)	CAN address	IP address
4	5	45	192.168.0.45

The IP address setting can be decoupled from the rotary switches using WorkBench (Settings -> Fieldbus-> TCP/IP).

3.2.4 CAN-Bus Termination

The last bus device on both ends of the CAN-Bus system must have termination resistors. The AKD has built-in 132 Ω resistors that can be activated by connecting pins 1 and 6. An optional termination plug is available for AKD (*AKD-CAN-TERMINATION*). The optional termination plug is an RJ25 connector with an enclosed wire jumper between pins 1&6. The termination plug should be inserted into the X13 connector of the last drive in the CAN network.

3.2.5 CAN-Bus Cable

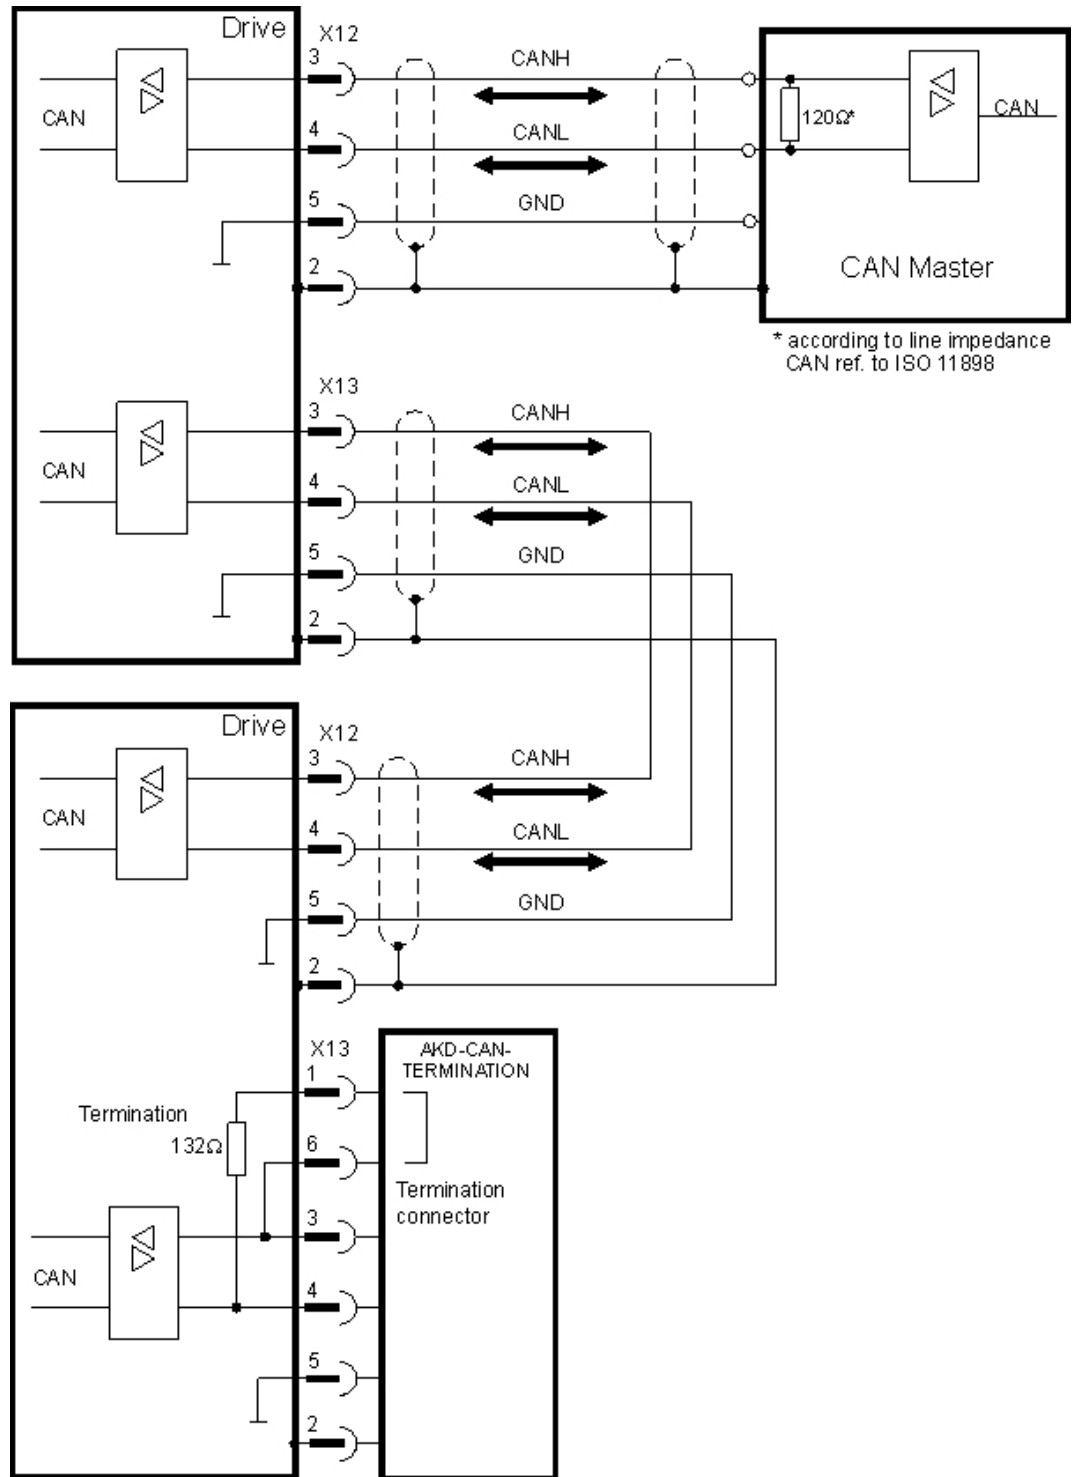

To meet ISO 11898, a bus cable with a characteristic impedance of 120 Ω should be used. The maximum usable cable length for reliable communication decreases with increasing transmission speed. As a guide, you can use the following values which Kollmorgen has measured; however, these values are not assured limits:

- Characteristic impedance: 100–120 Ω
- Cable capacitance max.: 60 nF/km
- Lead loop resistance: 159.8 Ω /km

Transmission Rate (kBaud)	1,000	500	250
Maximum Cable Length (m)	10	70	115

Lower cable capacitance (max. 30 nF/km) and lower lead resistance (loop resistance, 115 Ω /1000m) make it possible to achieve greater distances. The characteristic impedance 150 \pm 5 Ω requires terminating resistor 150 \pm 5 Ω .

3.2.5.1 CAN-Bus Wiring

3.3 Guide to Setup

NOTICE

Only professional personnel with extensive knowledge of control and drive technology are allowed to setup the drive.

WARNING Automatic Restart!

Risk of death or serious injury for humans working in the machine. Drives with CAN-Bus are remote-controlled machines. They can start to move at any time without previous warning. The drive might restart automatically after power on, voltage dip or interruption of the supply voltage, depending on the parameter setting.

- Place a warning sign ("WARNING: Possible Automatic Start" or similar) to the machine.
- Ensure that power on is not possible while humans are in a dangerous zone of the machine.

NOTE

Refer to chapter "Important Configuration Parameters" (→ p. 21) for fieldbus parameter setting (FBUS.PARAMx).

1. Check assembly/installation. Check that all the safety instructions in the product manual for the drive and this manual have been observed and implemented. Check the setting for the station address and baud rate.
2. Connect PC, start WorkBench. Use the setup software WorkBench to set the parameters for the drive.
3. Setup basic functions. Start up the basic functions of the drive and optimize the current, speed and position controllers. This section of the setup is described in the in the online help of the setup software.
4. Save parameters. When the parameters have been optimized, save them in the drive.
5. Start up communication. The altered parameters will only become effective after a reboot (switch off 24V and switch on again). Adjust the transmission rate of the AKD to match the master.
6. Test communication. Check for the bootup message, when you switch on the drive. Do an SDO read access on index 0x1000 subindex 0 (Device Type).
7. Setup position controller. Setup the position controller, as described in the WorkBench online help.

3.4 Important Configuration Parameters

The AKD holds several fieldbus-specific, general purpose parameters. Some of them contain the following relevant data:

FBUS.PARAM01:

Sets the baud rate for the CANbus. Supported baud rates are 125, 250, 500 and 1000 kBaud. On AKD-C, FBUS.PARAM01 sets and stores the EtherCAT station alias for the ESC (EtherCAT slave controller) of string 2.

FBUS.PARAM02:

This parameter activates the synchronization feature of the AKD. The DC feature must be activated in order to allow the AKD to get synchronized with the master. Only works when FBUS.TYPE = 3 (CANopen).

Drive internal PLL (phase locked loop) functionality: enabled (1),

Drive internal PLL functionality: disabled (0).

FBUS.PARAM03:

This parameter contains the Configured Station Alias address of the AKD. An EEPROM emulation write access to the Configured Station Alias address forces the AKD to store the drive parameters automatically using the DRV.NVSAVE command. On AKD-C, FBUS.PARAM03 sets and stores the EtherCAT station alias for the ESC (EtherCAT slave controller) of string 1.

FBUS.PARAM04:

This parameter enables (1) or disables (0) the synchronization supervision of the CANopen or EtherCAT fieldbus.

Default values for this parameter are as follows:

CANopen drive: disabled (0)

EtherCAT drive: enabled (1)

Synchronization supervision is active when FBUS.PARAM 04 = 1 and the first CANopen Sync message or first EtherCAT frame is received. When more than three CANopen sync messages or seven EtherCAT frames have not been received and the drive is enabled, fault F125 ("Synchronization lost"), occurs.

FBUS.PARAM05:

Bit 0	1	Faults can only be reset using DS402 controlword bit 7.
	0	The reset can also be done using Telnet or digital input and the DS402 state machine reflects this condition.
Bit 1	1	The state of the hardware enable does not change the state machine to state Operation enable.
	0	If the state Operation enable or Switched on is active, it falls back to the state Switch on disabled, if the Hardware enable goes to 0.
Bit 2	1	WorkBench/Telnet cannot software enable the drive when CANopen/EtherCAT are operational.
	0	WorkBench/Telnet can software enable the drive.
		NOTE During commissioning this bit should be set to 1 to avoid influences to DS402 power stage state machine. The fieldbus should not be in operation to avoid influence to test functions of WorkBench.
Bit 3	1	DS402 - state machine is not influenced if the software enable is taken away using Telnet.
	0	DS402 - state machine is influenced if the software enable is taken away using Telnet.

Bit 4	1	Scaling is done using special DS402 - objects (independent on units)
	0	Scaling for position, velocity and acceleration objects is done using UNIT parameters.
Bit 5 (EtherCAT only)	1	FBUS.PARAM03 defines the station alias address if not 0. If FBUS.PARAM03 is set to 0, the address will be taken from rotary switches if they are not 0. The EtherCAT master has the ability to use the alias address selected by the drive or issue its own.
	0	The rotary switches define the station alias address if not 0. If the rotary switches are set to 0, the address is taken from FBUS.PARAM03 instead, if it is not 0.
Bit 6	1	Bit 0 of parameter MT.CNTL (object 35B9 sub 0) can be accessed.
	0	Bit 0 of parameter MT.CNTL (object 35B9 sub 0) is exclusively used for DS402 controlword.
Bit 7	1	All capture objects (0x20A0-0x20A3, 0x20A6, 0x20A7, 0x60BA to 0x60BD) are scaled as object 0x6063.
	0	All capture objects (0x20A0-0x20A3, 0x20A6, 0x20A7, 0x60BA to 0x60BD) are scaled as object 0x6064.
Bit 8	1	DS402 - state Switched on means power stage disabled.
	0	DS402 - state Switched on means power stage enabled.
Bit 9	1	SDO content of object 0x6063 is the same as PDO content.
	0	SDO content of object 0x6063 depends on AKD unit parameters.
Bit 10 (Bit 10 is active only, if Bit 8 is set)	1	State Switched on can be reached without the high-level voltage being active.
	0	State Switched on can only be reached when the high-level voltage is active; otherwise the drive stays in Ready to switch on.
Bit 11	1	No emergency messages over CANopen are triggered when a drive warning occurs.
	0	Emergency messages over CANopen are triggered when a drive warning occurs.
Bit 12		reserved
Bit 13 (EtherCAT only)	1	Downloaded parameter file is stored automatically to nonvolatile memory.
	0	Downloaded parameter file is not stored automatically to nonvolatile memory.
Bit 14	1	If a warning occurs which limits a movement of the motor bit 11 in the DS402 statusword is additionally set to bit 7.
	0	Only bit 7 is set when any warning occurs.
Bit 15	1	The bit 10 of the statusword (target reached) is also set as a reaction to the halt bit (bit 8) of the controlword when the motor velocity is below CS.VTHRESH.
	0	Bit 10 of the statusword is only set when the external setpoint value of a movement is reached, e.g., target position in profile position mode.
Bit 16	1	The hardware enable input decides if the transitions between Switch on disabled and Ready to switch on are taken.
	0	The decision relies on the DS402 controlword.

FBUS.PARAM06 to FBUS.PARAM10:

4 CANopen Basics

4.1 Basic Features implemented by CANopen	24
4.2 Transmission Rate and Procedure	24
4.3 Response to BUSOFF Communication Faults	24

4.1 Basic Features implemented by CANopen

It is assumed that the basic operating functions of the communication profile are known and available as reference documentation. When working with the position controller that is integrated in AKD, the following functions are available:

Setup and general functions:

- Homing, set reference point
- Provision of a digital setpoint for speed and torque control
- Support of the following modes of the CANopen Profile DS402:
 - Profile position mode, Profile torque mode, Profile velocity mode
 - Homing mode
 - Interpolated position mode
 - Cyclic synchronous position mode

Positioning functions:

- Execution of a motion task from the motion block memory of the drive
- Execution of a direct motion task
- Absolute trajectory, ip-Mode or csp-Mode

Data transfer functions:

- Transmit a motion task to the drive's motion block memory. A motion task consists of these elements:
 - Position setpoint (absolute task) or path setpoint (relative task)
 - Speed setpoint
 - Acceleration time, braking time
 - Type of motion task (absolute/relative)
 - Number of a following task (with or without pause)
- Read a motion task from the motion block memory of the drive
- Read actual values
- Read the error register (Emergency error codes)
- Read the status register
- Read/write control parameters

4.2 Transmission Rate and Procedure

- Bus connection and bus medium: CAN-standard ISO 11898 (CAN high-speed)
- Transmission rate: max. 1Mbit/s
- Possible settings for the drive: 125 (default), 250, 500 and 1000 kbit/s
- Setting FBUS.PARAM01 to 0 enables the automatic baud rate detection.
- The baud rate is set with the AKD - parameter FBUS.PARAM01. It gets effective by saving this parameter to NVRAM and re-starting the drive.

4.3 Response to BUSOFF Communication Faults

The communication fault BUSOFF is directly monitored and signaled by Level 2 (CAN controller). This message may have various causes. A few examples:

- Telegrams are transmitted, although there is no other CAN node connected
- CAN nodes have different transmission rates
- The bus cable is faulty
- Faulty cable termination causes reflections on the cable.

A BUSOFF is only signaled by the AKD, if another CAN node is connected and at least one object was successfully transmitted to start off with. The BUSOFF condition is signaled by the error message 702. If the output stage is enabled at the moment when this fault occurs, the output stage is disabled.

5 CANopen Communication Profile

5.1	General Description of CAN	26
5.2	Construction of the Communication Object Identifier	27
5.3	Definition of the Used Data Types	28
5.4	Communication Objects	30

5.1 General Description of CAN

This chapter describes the basic services and communication objects of the CANopen communication profile DS 301, which are used in the AKD.

NOTE

It is assumed that the basic operating functions of the communication profile are known, and available as reference documentation.

The transmission method that is used here is defined in ISO 11898 (Controller Area Network CAN for high-speed communication).

The Layer-1/2 protocol (Physical Layer/Data Link Layer) that is implemented in all CAN modules provides, amongst other things, the requirements for data.

Data transport or data request is made by means of a data telegram (Data Frame) with up to 8 bytes of user data, or by a data request telegram (Remote Frame).

Communication objects (COBs) are labeled by an 11-bit Identifier (ID) that also determines the priority of objects.

A Layer-7 protocol (Application Layer) was developed, to decouple the application from the communication. The service elements that are provided by the Application Layer make it possible to implement an application that is spread across the network. These service elements are described in the CAN Application Layer (CAL) for Industrial Applications.

The communication profile CANopen and the drive profile are mounted on the CAL.

The basic structure of a communication object is shown in the following diagram:

SOM	Start of message
COB-ID	Communication Object Identifier (11-bit)
RTR	Remote Transmission Request
CTRL	Control Field (e.g. Data Length Code)
Data Segment	0 to 8byte (Data-COB) 0byte (Remote-COB)
CRC	Cyclic Redundancy Check
ACK	Acknowledge slot
EOM	End of message

5.2 Construction of the Communication Object Identifier

The following diagram shows the layout of the COB Identifier (COB ID). The Function Code defines the interpretation and priority of the particular object.

10	9	8	7	6	5	4	3	2	1	0
Function Code				Module ID						

Bit 0 .. 6

Module ID (drive's CAN-bus address, range 1 to 127; is set up in WorkBench or the drive,)

Bit 7 to 10

Function Code (number of the communication object that is defined in the server)

NOTE

If an invalid station number (=0) is set, then the module will be set internally to 1.

The following tables show the default values for the COB ID after switching on the drive. The objects, which are provided with an index (Communication Parameters at Index), can have a new ID assigned after the initialization phase. The indices in brackets are optional.

Predefined broadcast objects (send to all nodes):

Object	Function Code (binary)	Resulting COB IDs		Communication Parameters at index
		Dec.	Hex.	
NMT	0000	0	0	—
SYNC	0001	128	80	(1005)
TIME	0010	256	100	not supported

Predefined Peer-to-Peer objects (node sends to node):

Object	Function Code (binary)	Resulting COB IDs		Communication Parameters at index	Priority
		Dec.	Hex.		
EMERGENCY	0001	129..255	81..FF	—	high
TPDO 1	0011	385..511	181..1FF	1800	
RPDO 1	0100	513..639	201..27F	1400	
TPDO 2	0101	641..767	281..2FF	1801	
RPDO 2	0110	769..895	301..37F	1401	
TPDO 3	0111	897..1023	381..3FF	1802	
RPDO 3	1000	1025..1151	401..47F	1402	
TPDO 4	1001	1153..1279	481..4FF	1803	
RPDO 4	1010	1281..1407	501..57F	1403	
SDO (tx*)	1011	1409..1535	581..5FF		
SDO (rx*)	1100	1537..1663	601..67F		
Nodeguard	1110	1793..1919	701..77F	(100E)	low

*tx = direction of transmission: AKD => Master

rx = direction of transmission: Master => AKD

5.3 Definition of the Used Data Types

This chapter defines the data types that are used. Each data type can be described by bit-sequences. These bit-sequences are grouped into "Octets" (bytes). The so-called "Little – Endian" format (a.k.a. Intel format) is used for numerical data types (see also: DS301 Application Layer "General Description of Data Types and Encoding Rules").

5.3.1 Basic data types

5.3.1.1 Unsigned Integer

Data in the basic data type UNSIGNEDn define exclusively positive integers.

The value range is from 0 to 2^n-1 . The bit sequence $b = b_0$ to b_{n-1} defines the value $UNSIGNEDn(b) = b_{n-1} 2^{n-1} + \dots + b_1 2^1 + b_0 2^0$

Example: the value 266 = 10Ah is transmitted in the data type UNSIGNED16, in the form of two octets (1st octet = 0Ah, 2nd octet = 01h).

Transmission syntax for the data type UNSIGNEDn

Octet number	1.	2.	3.	4.
UNSIGNED8	b_7 to b_0			
UNSIGNED16	b_7 to b_0	b_{15} to b_8		
UNSIGNED24	b_7 to b_0	b_{15} to b_8	b_{23} to b_{16}	
UNSIGNED32	b_7 to b_0	b_{15} to b_8	b_{23} to b_{16}	b_{31} to b_{24}
UNSIGNED40	b_7 to b_0	b_{15} to b_8	b_{23} to b_{16}	b_{31} to b_{24}
UNSIGNED48	b_7 to b_0	b_{15} to b_8	b_{23} to b_{16}	b_{31} to b_{24}
UNSIGNED56	b_7 to b_0	b_{15} to b_8	b_{23} to b_{16}	b_{31} to b_{24}
UNSIGNED64	b_7 to b_0	b_{15} to b_8	b_{23} to b_{16}	b_{31} to b_{24}

Octet number	5.	6.	7.	8.
UNSIGNED8				
UNSIGNED16				
UNSIGNED24				
UNSIGNED32				
UNSIGNED40	b_{39} to b_{32}			
UNSIGNED48	b_{39} to b_{32}	b_{47} to b_{40}		
UNSIGNED56	b_{39} to b_{32}	b_{47} to b_{40}	b_{55} to b_{48}	
UNSIGNED64	b_{39} to b_{32}	b_{47} to b_{40}	b_{55} to b_{48}	b_{63} to b_{56}

5.3.1.2 Signed Integer

Data in the basic data type INTEGER_n define both positive and negative integers.

The value range is from $-2^{n-1}-1$ to $2^{n-1}-1$. The bit sequence $b = b_0$ to b_{n-1} defines the value $\text{INTEGER}_n(b) = b_{n-2} 2^{n-2} + \dots + b_1 2^1 + b_0 2^0$ with $b_{n-1} = 0$

Negative numbers are represented as 2's complement, which means:

$\text{INTEGER}_n(b) = -\text{INTEGER}_n(b) - 1$ with $b_{n-1} = 1$

Example: the value -266 = FEF6h is transmitted in the data type INTEGER16, in the form of two octets (1st octet = F6h, 2nd octet = FEh).

Transmission syntax for the data type INTEGER_n

Octet number	1.	2.	3.	4.
INTEGER8	b ₇ to b ₀			
INTEGER16	b ₇ to b ₀	b ₁₅ to b ₈		
INTEGER24	b ₇ to b ₀	b ₁₅ to b ₈	b ₂₃ to b ₁₆	
INTEGER32	b ₇ to b ₀	b ₁₅ to b ₈	b ₂₃ to b ₁₆	b ₃₁ to b ₂₄
INTEGER40	b ₇ to b ₀	b ₁₅ to b ₈	b ₂₃ to b ₁₆	b ₃₁ to b ₂₄
INTEGER48	b ₇ to b ₀	b ₁₅ to b ₈	b ₂₃ to b ₁₆	b ₃₁ to b ₂₄
INTEGER56	b ₇ to b ₀	b ₁₅ to b ₈	b ₂₃ to b ₁₆	b ₃₁ to b ₂₄
INTEGER64	b ₇ to b ₀	b ₁₅ to b ₈	b ₂₃ to b ₁₆	b ₃₁ to b ₂₄

Octet number	5.	6.	7.	8.
INTEGER8				
INTEGER16				
INTEGER24				
INTEGER32				
INTEGER40	b ₃₉ to b ₃₂			
INTEGER48	b ₃₉ to b ₃₂	b ₄₇ to b ₄₀		
INTEGER56	b ₃₉ to b ₃₂	b ₄₇ to b ₄₀	b ₅₅ to b ₄₈	
INTEGER64	b ₃₉ to b ₃₂	b ₄₇ to b ₄₀	b ₅₅ to b ₄₈	b ₆₃ to b ₅₆

5.3.2 Mixed data types

Mixed data types combine basic data types (INTEGER_n, UNSIGNED_n, REAL). Two types of mixed data are distinguished:

- STRUCT: This data type is composed of elements with different data types.
- ARRAY: This data type is composed of elements of the same data type.

5.3.3 Extended data types

Extended data types are derived from basic data types and mixed data types. The types of extended data that are supported are defined below.

5.3.3.1 Octet String

The data type OCTET_STRING is defined with the data type ARRAY. Length is the length of the octet string.

ARRAY[length] OF UNSIGNED8	OCTET_STRINGlength
----------------------------	--------------------

5.3.3.2 Visible String

The data type VISIBLE_STRING can be defined with the data type UNSIGNED8 or the data type ARRAY. Permissible values are 00h and the range from 20h to 7Eh. The data are interpreted as 7 bit ASCII code (as per ISO 646-1973(E)). Length is the length of the visible string.

UNSIGNED8	VISIBLE_CHAR
ARRAY[length] OF VISIBLE_CHAR	VISIBLE_STRINGlength

5.4 Communication Objects

Communication objects are described with the help of service elements and protocols. Two basic types of service elements are used.

- Unconfirmed services PDO
- Confirmed services SDO

All services require faultless operation of the Data Link and Physical Layer.

AKD supports communication objects that are described in detail in the following sections:

- Network Management Objects (NMT)
- Synchronization Object (SYNC)
- Emergency Object (EMCY)
- Process Data Object (PDO)
- Service Data Object (SDO)
- Nodeguard/Heartbeat

5.4.1 Network Management Objects (NMT)

The following diagram describes the NMT telegram:

The drive supports the following network management functions:

cs = 129, reset node:

Causes a communication re-start. Resets all communication/mapping parameters.

cs = 130, reset communication node:

Causes a stop of PDO-communication, gives a new bootup-message

cs = 1, start remote node:

Starts the CAN node. I.e. the PDOs of the drive are enabled for operation. From this moment, transmit-PDOs will be transmitted under event-control, and cyclical process data operation can commence.

cs = 2, stop remote node:

Stops the CAN node, I.e. the drive no longer responds to any received PDOs or transmits any PDOs.

5.4.2 Synchronization Object (SYNC)

The SYNC object usually is used as a periodic Broadcast Object and provides the basic clock for the bus. SYNC has a high priority, to ensure constant time intervals. The usage of this protocol is explained in the appendix from page . You can use the SYNC object to start motion task of several axes simultaneously for example.

5.4.3 Time-Stamp Object (TIME)

This communication object is not supported by the AKD.

5.4.4 Emergency Object (EMCY)

EMCY is event-triggered and generated by an internal fault/error situation. This object is transmitted afresh for every error. Since the error codes are device-dependent, they are described in the Chapter *"CANopen Emergency Messages and Error Codes"* (→ p. 41). The last 10 Emergency error codes can be read via object 1003.

5.4.4.1 Application of the Emergency Object

The reaction in the event of an error or fault depends on the error class and is therefore variable. For this reason, the reaction is described with the aid of an error state machine. The error conditions error-free and error occurred are distinguished. Defined transitions:

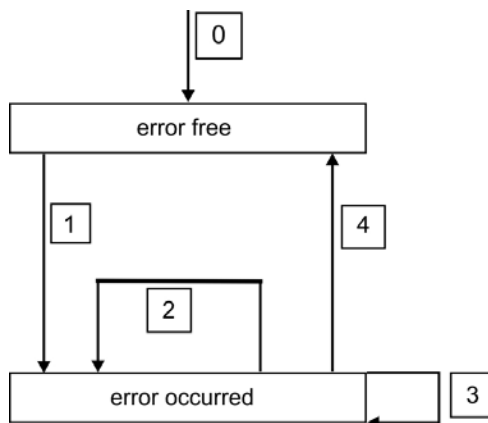

Transition 0: After initialization, the error-free status is taken up if no errors are detected. No error signal is generated in this condition.

Transition 1: The AKD detects an internal error and indicates this in the first three bytes of the emergency telegram (error code in Bytes 0,1 and error register in Byte 2).

Transition 2: One error has been reset, but not all. The EMCY telegram contains error code 0000 and the error register indicates the remaining errors that are present. The manufacture-specific area is set to zero.

Transition 3: A new error has occurred. The AKD remains in the error status and transmits an EMCY Object with the corresponding error code. The new error code is entered into bytes 0 and 1.

Transition 4: All errors have been reset. The EMCY telegram contains the error code 0000, The error register does not indicate any other errors. The manufacture-specific area is set to zero.

5.4.4.2 Composition of the Emergency Object

The Emergency Object is composed of 8 bytes, divided as follows:

Byte	0	1	2	3	4	5	6	7
Content	Emergency error code		Error register (object 1001)	Category	Reserved			

If an Emergency Object is generated, the error condition is then signaled to the state machine (error free/error occurred) by the generation of a second Emergency Object. Only the first four bytes are relevant in this case (Emergency Error code, Error register, Category). Byte 0/1 contains the Emergency Error Code (0000) and Byte 2 indicates if a possible further error is present. If the error register contains 00, the error status is error-free. Byte 3 contains the category. The interpretations of the error numbers (error code) and the error categories are described in the section Emergency Messages. The error register is defined by object 1001.

5.4.5 Service Data Objects (SDO)

SDOs are used to implement access to the Object Dictionary. The SDOs are required for parameterization and for status polling. Access to an individual object is made with a multiplexer via the Index and Subindex of the Object Dictionary. The following communication protocols are supported by AKD:

- Initiate SDO Download Protocol
- Download SDO Segment Protocol
- Initiate SDO Upload Protocol
- Upload SDO Segment Protocol
- Abort SDO Transfer Protocol

The definitions of the individual communication services and protocols can be found in DS301.

Examples of the usage of SDOs can be found in the appendix from → p. 161.

NOTE

Since a SDO is a confirmed service, the system must always wait for the SDO response telegram before it is allowed to transmit a new telegram.

5.4.5.1 Composition of the Service Data Object

An SDO consists of the following components:

Byte	1	2	3	4	5	6	7	8
Content	R/W	Index	Subindex	Data				

1. The control byte (Byte 1):

The control byte determines whether the SDO should write or read the content of the entry in the Object Dictionary. A description of the complete Object Dictionary for AKD → p. 133.

Data exchange with the AKD is governed by the *CMS multiplexed domain protocols* standard, as described in the CAN standard DS 202.

To read data, the control byte must be written in the manner shown below:

Bit	7	6	5	4	3	2	1	0
Content	ccs=2		X	X	X	X	X	X

ccs => client command specifier (ccs = 2 => initiate upload request)

X => free data

So a value of 0100 0000 (binary) or 40h must be transmitted in the control byte.

The drive sends back a corresponding response byte:

Bit	7	6	5	4	3	2	1	0
Content	scs=2		X	n	e	s		

scs => server command specifier (scs = 2 => initiate upload response)

n => only valid for e = s = 1, if this is so, n contains the number of bytes that do not contain data

X => free data

If reading is successful, the response byte always has set the bits 0 and 1 (e = s = 1).

Encoded byte length in the SDO response:

0x43 - 4 bytes

0x47 - 3 bytes

0x4B - 2 bytes

0x4F - 1 byte.

If an error occurs, scs is set to 4, the response byte is 0x80 and the error information is in the four byte data field. The decoding of the error see page 1

5.4.5.2 Initiate SDO Download Protocol

The Initiate SDO Download protocol is used for write access to objects with up to 4 bytes of user data (expedited transfer) or to initiate a segment transfer (normal transfer).

5.4.5.3 Download SDO Segment Protocol

The Download SDO Segment protocol is used for write access to objects with more than 4 bytes of user data (normal transfer).

5.4.5.4 Initiate SDO Upload Protocol

The SDO Upload protocol is used for read access to objects with up to 4 bytes of user data (expedited transfer) or to initiate a segment transfer (normal transfer).

5.4.5.5 Upload SDO Segment Protocol

The Upload SDO Segment protocol is used for read access to objects with more than 4 bytes of user data (normal transfer).

5.4.5.6 Abort SDO Protocol

The Abort SDO protocol breaks off SDO transmission, and indicates the error that caused the break in transmission through an abort code (error code). The error code is in the format of an UNSIGNED32 value. The following table shows possible reasons for an abort SDO.

Abort Code	Description
0504 0000h	SDO timeout
0504 0001h	Command specifier invalid
0504 0002h	SDO segmented: invalid blocksize
0504 0004h	SDO segmented: invalid block CRC
0504 0005h	SDO segmented: out of memory
0601 0001h	Attempted read access to a write-only object
0601 0002h	Attempted write access to a read-only object
0602 0000h	Object does not exist in Object Dictionary
0604 0041h	Object cannot be mapped to a PDO
0604 0042h	Size and number of mapped objects exceed permissible PDO length
0604 0043h	General parameter incompatibility
0606 0000h	SDO hardware fault
0607 0010h	Data type incompatible, length of service parameter is incompatible
0609 0011h	Subindex does not exist
0609 0030h	Outside value range for the parameter (only for write access)
0609 0031h	Parameter value too high
0609 0032h	Parameter value too low
0800 0020h	Data cannot be transmitted or saved
0800 0022h	Data cannot be transmitted or saved because of device status

Abort Codes not listed above are reserved.

5.4.6 Process Data Object (PDO)

PDOs are used for real-time data communication. PDOs can, for instance, be used to set up controllers similar to analog drives. Instead of +/-10VDC setpoints and ROD feedback, digital speed setpoints and position feedback are attained via PDOs in this case.

Transmission is carried out unconfirmed without a protocol "overhead". This communication object uses the unconfirmed communication service.

PDOs are defined via the Object Dictionary for the AKD. Mapping is made during the configuration phase, with the help of SDOs. Length is defined with the mapped objects.

The definition of the PDO service and protocol can be found in DS301. Examples of the usage of PDOs can be found in the appendix → p. 161.

Basically, two types of PDOs can be distinguished, depending on the direction of transmission:

- Transmit-PDOs (TPDOs) (AKD => Master)
The TPDOs transmit data from AKD to control system (for example actual value objects, instrument status).
- Receive-PDOs (RPDOs) (Master =>AKD)
The RPDOs receive data from control system to AKD (for example setpoints).

AKD supports four independent PDO channels for each direction of transmission. The channels are labeled by the channel numbers 1 to 4.

There are two parameter sets each for the configuration of each of the four possible PDOs, and they can be set up through the corresponding SDOs:

1. Mapping parameters, to determine which data are available (mapped) in the selected PDO and to define, which data are contained.
2. Communication parameters, that define whether the PDOs operate in synchronized mode, or event-driven (objects 1400h to 1403h, 1800h to 1803h).

5.4.6.1 Transmission modes

The following PDO transmission modes are distinguished:

- Synchronous transmission
- Asynchronous transmission

The pre-defined SYNC Object is transmitted periodically (bus clock), to synchronize the drives. Synchronous PDOs are transmitted within a pre-defined time window immediately following the SYNC Object.

The transmission modes are set up with the aid of the PDO communication parameters.

5.4.6.2 Trigger modes

Three different trigger modes are distinguished:

- **Event driven:** The transmission of the telegrams is triggered by an object-specific event.
- **Time driven:** If event driven signals put a high strain on the bus, you can determine the period of time after which a PDO can be transmitted again via the inhibit time (Communication parameter, Subindex 03h)
- **Event Timer driven:** If a PDO shall be sent within a defined time interval, even if it doesn't change, this interval can be defined by a special SDO.

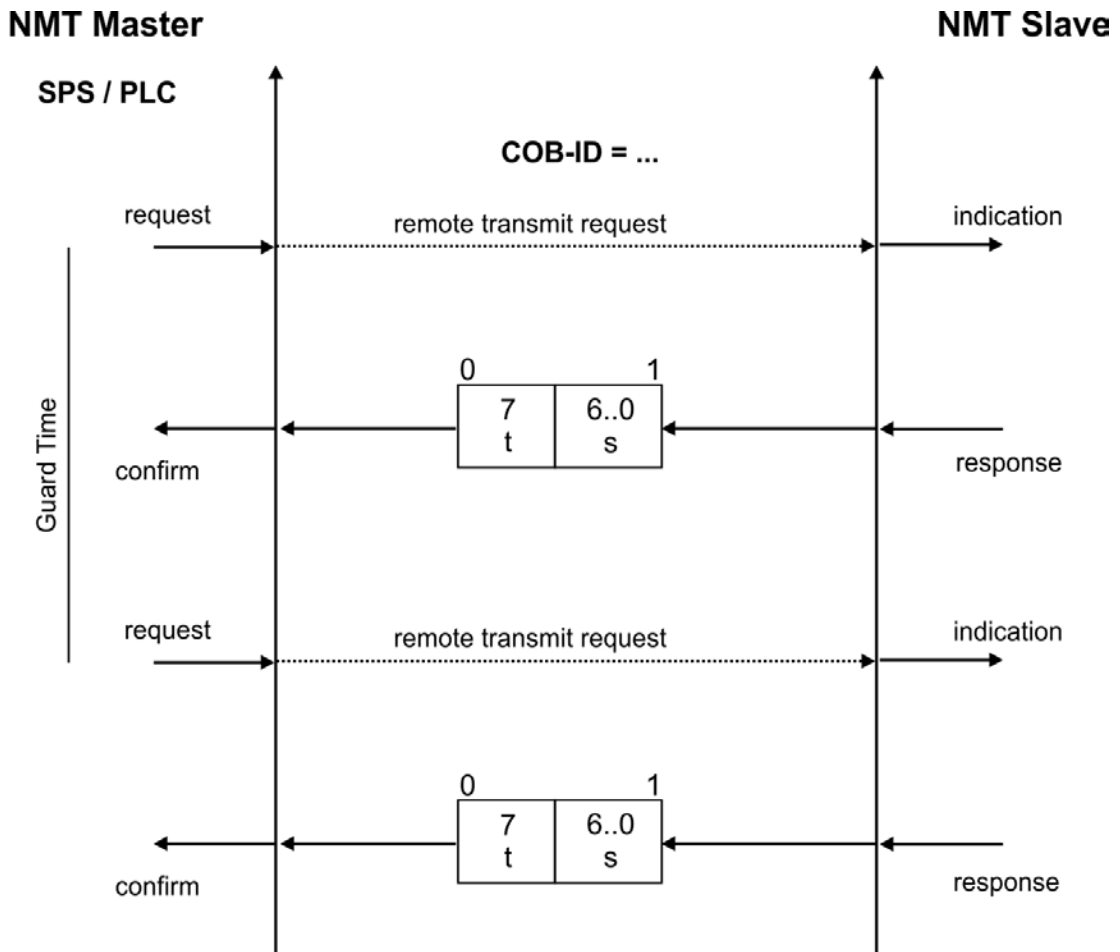

5.4.7 Nodeguard

The Node Guarding protocol is a functional monitoring for the drive. It requires that the drive is accessed at regular intervals by the CANopen master.

The maximum time interval that is permitted between two Nodeguard telegrams is given by the product of the Guard Time (Object 100Ch) and the Life Time Factor (Object 100Dh). If one of these two values is 0, then the response monitoring is de-activated.

If the drive is not accessed within the time defined by objects 100Ch and 100Dh, then fault F129 (response monitoring) appears on the drive, the drive is braked to a stop, and any other movement is prevented.

The time sequence for node guarding is as shown below:

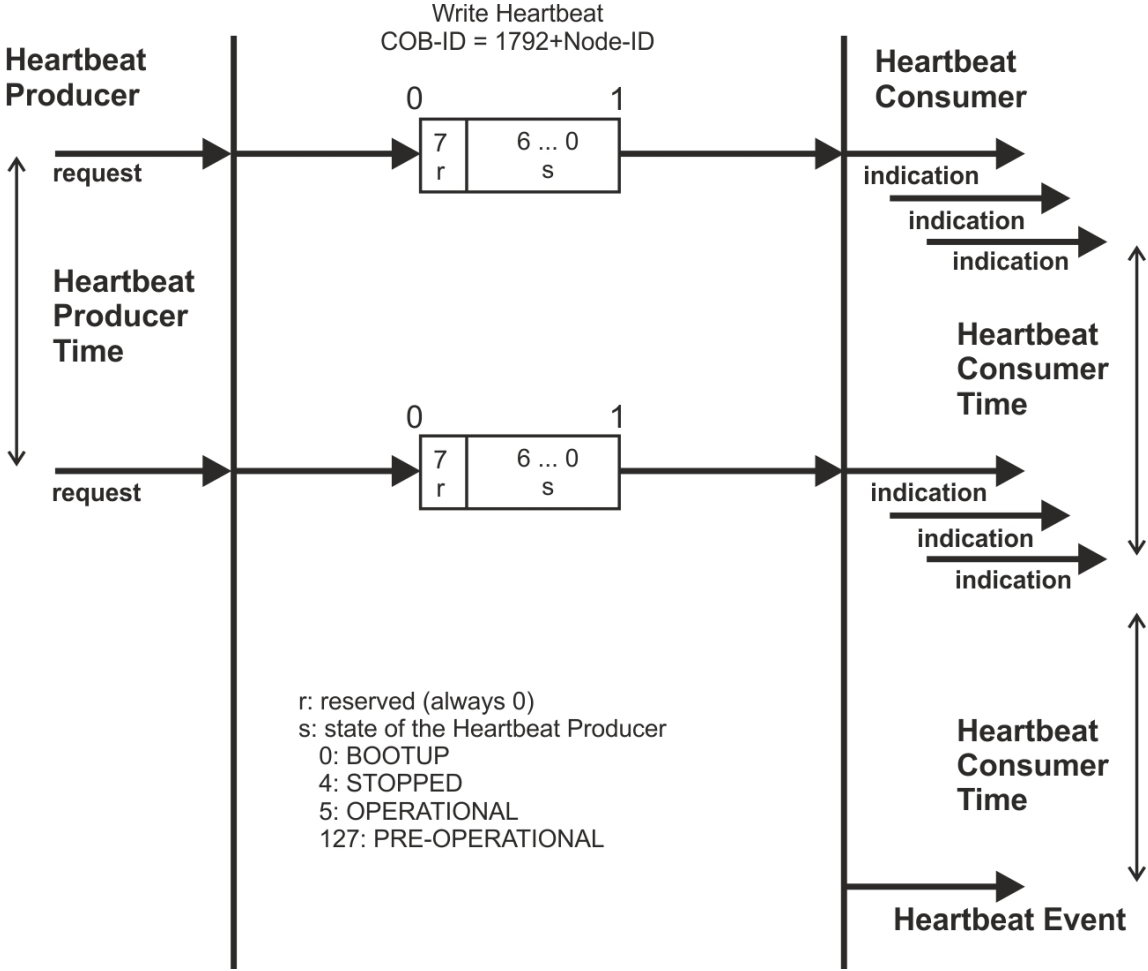

t = toggle Bit, changes its status with every slave telegram
 s = status of the NMT slave state machine

Node guarding is carried out by the Master through RTR telegrams with the COB-ID 700h + slave node address.

5.4.8 Heartbeat

The Heartbeat Protocol defines an Error Control Service without need for remote frames. A Heartbeat Producer transmits a Heartbeat message cyclically. One or more Heartbeat Consumer receive the indication. The relationship between producer and consumer is configurable via Object 1016h/1017h. The Heartbeat Consumer guards the reception of the Heartbeat within the Heartbeat Consumer Time. If the Heartbeat is not received within the Heartbeat Consumer Time a Heartbeat Event will be generated.

Heartbeat protocol:

6 CANopen Drive Profile

6.1 CANopen Emergency Messages and Error Codes	41
6.2 General Definitions	46
6.3 PDO Configuration	84
6.4 Device Control (dc)	92
6.5 Factor Groups (fg) (DS402)	99
6.6 Profile Velocity Mode (pv) (DS402)	109
6.7 Profile Torque Mode (tq) (DS402)	110
6.8 Position Control Function (pc) (DS402)	115
6.9 Interpolated Position Mode (ip) (DS402)	117
6.10 Homing Mode (hm) (DS402)	122
6.11 Profile Position Mode (DS402)	126

6.1 CANopen Emergency Messages and Error Codes

Emergency messages are triggered by internal equipment errors. They have a high ID-priority to ensure quick access to the bus. An emergency message contains an error field with pre-defined error/fault numbers (2 bytes), an error register (1byte), the error category (1 byte), and additional information. Error numbers 0000h to 7FFFh are defined in the communication or drive profile. Error numbers FF00h to FFFFh have manufacturer-specific definitions.

Starting with firmware version 1-18-03-000 the keyword CANOPEN.ADDMANUEMNCYCODE can be set to 1 to enable adding manufacturer specific information to the additional information field. When enabled, the additional information will contain the warning or fault number as ASCII characters.

Error Code	Fault/Warning	Description
0x0000	0	Emergency error free.
0x1080	-	General Warning.
0x1081	-	General Error.
0x3110	F523	DC Bus link over voltage FPGA.
0x3120	F247	DC Bus link voltage exceed allowed thresholds.
0x3130	F503	DC Bus link capacitor overload.
0x3180	n503	Warning: DC Bus link capacitor overload.
0x3210	F501	DC Bus link over-voltage.
0x3220	F502	DC Bus Link under-voltage.
0x3280	n502	Warning: DC Bus Link under-voltage.
0x3281	n521	Warning: Dynamic Braking I ² T.
0x3282	F519	Regen short circuit.
0x3283	n501	Warning: DC Bus link over-voltage.
0x4210	F234	Excessive temperature, device (control board).
0x4310	F235	Excessive temperature, drive (heat sink).
0x4380	F236	Power temperature sensor 2 high.
0x4381	F237	Power temperature sensor 3 high.
0x4382	F535	Power board overtemperature.
0x4390	n234	Warning: Control temperature sensor 1 high.
0x4391	n235	Warning: Power temperature sensor 1 high.
0x4392	n236	Warning: Power temperature sensor 2 high.
0x4393	n237	Warning: Power temperature sensor 3 high.
0x4394	n240	Warning: Control temperature sensor 1 low.
0x4395	n241	Warning: Power temperature sensor 1 low.
0x4396	n242	Warning: Power temperature sensor 2 low.
0x4397	n243	Warning: Control temperature sensor 1 low.
0x4398	F240	Control temperature sensor 1 low.
0x4399	F241	Power temperature sensor 1 low.
0x439A	F242	Power temperature sensor 2 low.
0x439B	F243	Power temperature sensor 3 low.
0x5113	F512	5V0 under voltage.
0x5114	F505	1V2 under voltage.
0x5115	F507	2V5 under voltage.
0x5116	F509	3V3 under voltage.
0x5117	F514	+12V0 under voltage.
0x5118	F516	-12V0 under voltage.

Error Code	Fault/Warning	Description
0x5119	F518	Analog 3V3 under voltage.
0x5180	F504	1V2 over voltage.
0x5181	F506	2V5 over voltage.
0x5182	F508	3V3 over voltage.
0x5183	F510	5V0 over voltage.
0x5184	F513	+12V0 over voltage.
0x5185	F515	-12V0 over voltage.
0x5186	F517	Analog 3V3 over voltage.
0x5530	F105	Hardware memory, non-volatile memory stamp invalid.
0x5580	F106	Hardware memory, non-volatile memory data.
0x5589	F124	Cogging compensation non volatile memory data error (CRC).
0x5590	F204	Control board EEPROM read failed.
0x5591	F205	Control board EEPROM corrupted serial num stamp.
0x5592	F206	Control board EEPROM corrupted serial num data.
0x5593	F207	Control board EEPROM corrupted parameter stamp.
0x5594	F208	Control board EEPROM corrupted parameter data.
0x5595	F219	Control board EEPROM write failed.
0x55A0	F209	Power board EEPROM read failed.
0x55A1	F210	Power board EEPROM corrupted serial num stamp.
0x55A2	F212	Power board EEPROM corrupted serial num data.
0x55A3	F213	Power board EEPROM corrupted parameter stamp.
0x55A4	F214	Power board EEPROM corrupted parameter data.
0x55A5	F230	Power board EEPROM write failed.
0x55A6	F232	Power board EEPROM invalid data.
0x55B0	F248	Option board EEPROM corrupted.
0x55B1	F249	Option board upstream checksum.
0x55B2	F250	Option board upstream checksum.
0x55B3	F251	Option board watchdog.
0x55B8	F252	Firmware and option board FPGA types are not compatible.
0x55B9	F253	Firmware and option board FPGA versions are not compatible.
0x55C0	F621	Control Board CRC fault.
0x55C1	F623	Power Board CRC fault.
0x55C2	F624	Power Board Watchdog fault.
0x55C3	F625	Power Board Communication fault.
0x55C4	F626	Power Board FPGA not configured.
0x55C5	F627	Control Board Watchdog fault.
0x55C6	n103	Warning: Resident FPGA .
0x55C7	n104	Warning: Operational FPGA .
0x6080	F631	Issue command timed out
0x6380	F532	Drive motor parameters setup incomplete.
0x6381	F120	Failed to set default parameters.
0x7180	F301	Motor overheat.
0x7182	F305	Motor Brake open circuit.
0x7183	F306	Motor Brake short circuit.
0x7184	F307	Motor Brake applied during enable state.

Error Code	Fault/Warning	Description
0x7185	F436	EnDAT overheated.
0x7186	n301	Warning: Motor overheated.
0x7187	F308	Voltage exceeds motor rating.
0x7188	F560	Regen near capacity, could not prevent over voltage.
0x7189	F312	Brake released when it should be applied.
0x7305	F417	Broken wire in primary feedback.
0x7380	F402	Feedback 1 Analog signal amplitude default.
0x7381	F403	Feedback 1 EnDat communication fault.
0x7382	F404	Feedback 1 illegal hall state.
0x7383	F405	Feedback 1 BiSS watchdog.
0x7384	F406	Feedback 1 BiSS multi cycle.
0x7385	F407	Feedback 1 BiSS sensor.

0xFF15	n101	Warning: The FPGA is a laboratory FPGA.
0xFF16	n602	Warning: Safe torque off.
0xFF17	F132	Secondary feedback Z line break.

Error Code	Fault/Warning	Description
0xFF18	n603	Warning: OPMODE incompatible with CMDSOURCE.
0xFF19	n604	Warning: EMUEMODE incompatible with DRV.HANDWHEELSRC.

6.2 General Definitions

This chapter describes objects with a general validity (e.g. Object 1000h Device Type). The next section explains the free configuration of Process Data Objects ("free mapping").

6.2.1 General objects

6.2.1.1 Object 1000h: Device Type (DS301)

This object describes the device type (servo drive) and device functionality (DS402 drive profile). Definition:

MSB				LSB			
Additional information				Device profile number			
Mode bits		Type		402d=192h			
31	24	23	16	15	0		

The device profile number is DS402, the type is 2 for drives, the mode bits 28 to 31 are manufacturer specific and may be changed from its actual value of 0. A read access delivers 0x00020192 at the moment.

Index	1000h
Name	device type
Object code	VAR
Data type	UNSIGNED32
Category	mandatory
Access	R/O
PDO mapping	not possible
Value range	UNSIGNED32
Default value	no

6.2.1.2 Object 1001h: Error register (DS301)

This object is an error register for the device. The device can map internal errors into this byte. It is a part of an Emergency object.

Index	1001h
Name	Error register
Object code	VAR
Data type	UNSIGNED8
Category	mandatory
Access	R/O
PDO mapping	not possible
Value range	UNSIGNED8
Default value	no

Error reasons to be signaled: If a bit is set to 1 the specified error has occurred. The generic error is signaled at any error situation.

Bit	Description	Bit	Description
0	generic error	4	communication error (overrun, error state)
1	current	5	device profile specific
2	voltage	6	reserved (always 0)
3	temperature	7	manufacturer specific

6.2.1.3 Object 1002h: Manufacturer Status Register (DS301)

The manufacturer status register contains important device information.

Index	1002h
Name	Manufacturer Status Register
Object code	VAR
Data type	UNSIGNED32
Category	optional
Access	R/O
PDO mapping	possible
Value range	UNSIGNED32
Default value	no

The following table shows the bit assignment for the status register:

Bit	Description	Bit	Description
0	1 = Movement (positioning, homing) active	16	1 = Homing move active
1	reference position set	17	reserved
2	1 = reference switch high (home-position)	18	reserved
3	1 = In Position	19	1 = Emergency stop active
4	1 = Current (torque) limitation active	20	reserved
5	reserved	21	reserved
6	reserved	22	reserved
7	Active Disable activated	23	1 = Homing move finished
8	Warning active	24	Power stage deactivating
9	1 = target velocity reached (pp- or pv-Mode)	25	1 = digital input 1 set
10	reserved	26	1 = digital input 2 set
11	1 = Homing error	27	1 = digital input 3 set
12	1 = Motor standstill	28	1 = digital input 4 set
13	1 = Safe Torque Off selected	29	1 = Power Ready signal from the power supply is enabled (similar to hardware enable)
14	1 = Power stage enabled	30	1 = Wake and Shake action is required
15	1 = Error state	31	Braking, 1 = set points not accepted

The following table shows the bit assignments differences from the table above for the power supply status register:

Bit	Description
13	STO string 1
14	STO string 2
15	Error state
29	digital input hardware enable set

6.2.1.4 Object 1003h: Predefined Error Field (DS301)

The object 1003h provides an error history with a maximum size of 10 entries.

Subindex 0 contains the number of errors which have occurred since the last reset of the error history, either by startup of the drive or resetting the error history by writing 0 to subindex 0.

A new Emergency-message is written into subindex 1 shifting the old entries one subindex higher. The old content of subindex 8 is lost.

The UNSIGNED32-information written to the subindexes is defined in the field Error Code in the description of the Emergency Messages (→ p. 41).

Index	1003h
Name	pre-defined Error Field
Object code	ARRAY
Data type	UNSIGNED32
Category	optional
Subindex	0
Description	highest sub-index supported
Data type	UNSIGNED8
Category	mandatory
Access	R/W
PDO mapping	not possible
Value range	0 to 10
Default value	0
Subindex	1 to 10
Description	Standard error field (→ p. 41)
Category	optional
Access	R/O
PDO mapping	not possible
Value range	UNSIGNED32
Default value	no

6.2.1.5 Object 1005h: COB-ID of the SYNC Message (DS301)

This object defines the COB-Id of the synchronisation object (SYNC).

Index	1005h
Name	COB-ID for the SYNC message
Object code	VAR
Data type	UNSIGNED32
Category	conditional
Access	R/W
PDO mapping	not possible
Value range	UNSIGNED32
Default value	0x80

Bit coded information:

Bit	Value	Meaning
31 (MSB)	X	—
30	0	Device not generate SYNC message
	1	Device generates SYNC message
29	0	11 Bit ID (CAN 2.0A)
	1	29 Bit ID (CAN 2.0B)
28 to 11	X	—
	0	if Bit 29=0
10 to 0 (LSB)	X	Bit 0 to 10 of SYNC COB-ID

The device does not support the generation of SYNC-messages and only the 11-bit IDs. So the bits 11 to 30 are always 0.

6.2.1.6 Object 1006h: Communication Cycle Period (DS301)

This object can be used to define the period (in μ s) for the transmission of the SYNC telegram.

Index	1006h
Name	Period of the communication cycle
Object code	VAR
Data type	UNSIGNED32
Category	O
Access	R/W
PDO mapping	not possible
Value range	UNSIGNED32
Default value	00h

6.2.1.7 Object 1008h: Manufacturer Device Name (DS301)

The device name consists of four ASCII characters in the form Yzzz, whereby Y stands for the mains voltage (L, M, H or U, e.g. H for High Voltage) zzz stands for the power stage current.

Index	1008h
Name	Manufacturer Device Name
Object code	VAR
Data type	Visible String
Category	Optional
Access	const
PDO mapping	not possible
Value range	
Default value	no

6.2.1.8 Object 1009h: Manufacturer Hardware Version

This object will be supported in the future.

Index	1009h
Name	manufacturer hardware version
Object code	VAR
Data type	Visible String
Category	Optional
Access	const
PDO mapping	not possible
Value range	-
Default value	no

6.2.1.9 Object 100Ah: Manufacturer Software Version (DS301)

The object contains the manufacturer software version (here: the CANopen-part of the drive firmware).

Index	100Ah
Name	Manufacturer Software Version
Object code	VAR
Data type	Visible String
Category	Optional
Access	const
PDO mapping	not possible
Value range	0.01 to 9.99
Default value	no

6.2.1.10 Object 100Ch: Guard Time (DS301)Response monitoring

The arithmetical product of the Objects 100Ch Guard Time and 100Dh Lifetime Factor is the response monitoring time. The Guard Time is given in milliseconds. The response monitoring is activated with the first Nodeguard object. If the value of the object Guard Time is set to zero, then the response monitoring is inactive.

Index	100Ch
Name	Guard Time
Object code	VAR
Data type	UNSIGNED16
Category	conditional; mandatory, if heartbeat not supported
Access	R/W
PDO mapping	not possible
Value range	UNSIGNED16
Default value	0

6.2.1.11 Object 100Dh: Lifetime Factor (DS301)

The product of Guard Time and Life Time Factor gives the life time for the nodeguarding protocol. If it's 0, the protocol is not used.

Index	100Dh
Name	Lifetime Factor
Object code	VAR
Data type	UNSIGNED8
Category	conditional; (mandatory, if heartbeat not supported)
Access	R/W
PDO mapping	not possible
Value range	UNSIGNED8
Default value	0

6.2.1.12 Object 1010h: Store Parameters (DS301)

This object supports the saving of parameters to a flash EEPROM. Only the subindex 1 for saving of all parameters, which can also be saved in the parameter files via the GUI, is supported.

Index	1010h
Name	store parameters (DRV.NVSAVE)
Object code	ARRAY
Data type	UNSIGNED32
Category	optional

Subindex	0
Name	highest sub-index supported
Object code	VAR
Data type	UNSIGNED8
Category	mandatory
Access	R/O
PDO Mapping	not possible
Value range	1
Default value	1

Subindex	1
Name	save all parameters
Object code	VAR
Data type	UNSIGNED32
Category	mandatory
Access	R/W
PDO Mapping	not possible
Value range	UNSIGNED32
Default value	1

Data definition:

Bit	Value	Meaning
31 to 2	0	reserved (=0)
1	0	Device does not save parameters autonomously
	1	Device does save parameters autonomously
0	0	Device does not save parameters on command
	1	Device does save parameters on command

By read access to subindex 1 the drive provides information about its storage functionality.

This drive provides a constant value of 1 by read access, i.e. all parameters can be saved by writing to Object 1010 sub 1. In general the drive does not save parameters autonomously with the exception of e.g. the special treatment of the homing of multiturn absolute encoders.

Storing of parameters is only done if a special signature ("save") is written to subindex 1.

"save" is equivalent to the unsigned32 - number 65766173h.

6.2.1.13 Object 1011h: Restore Default Parameters DS301

With this object the default values of parameters according to the communication or device profile are restored. The AKD gives the possibility to restore all default values.

Index	1011h
Name	restore default parameters
Object code	ARRAY
Data type	UNSIGNED32
Category	optional
Subindex	0
Name	highest sub-index supported
Object code	VAR
Data type	UNSIGNED8
Category	mandatory
Access	R/O
PDO Mapping	not possible
Value range	1
Default value	1
Subindex	1
Name	restore all default parameters (DRV.RSTVAR)
Object code	VAR
Data type	UNSIGNED32
Category	mandatory
Access	R/W
PDO Mapping	not possible
Value range	UNSIGNED32
Default value	1 (device restores parameter)

Restoring default parameters to the RAM will be done, if a special signature ("load") is written to subindex 1. "load" has to be transmitted as unsigned32 - number 64616F6Ch.

6.2.1.14 Object 1012h: COB-ID of the Time Stamp (DS301)

This object defines the COB-ID of the time stamp.

Index	1012h
Name	COB-ID for the time stamp
Object code	VAR
Data type	UNSIGNED32
Category	optional
Access	R/W
PDO mapping	not possible
Value range	UNSIGNED32
Default value	100h

Bit coded information:

Bit	Content	Value	Meaning
31 (MSB)	consume	0	Drive does not consume time message
		1	Drive does consume time message
30	produce	0	Drive does not produce time message
		1	Drive does produce time message
29	frame	0	Value fixed to 0
28 to 11	reserved	–	reserved
10 to 0 (LSB)	CAN-ID	0h - 800h	COB-ID of the time stamp

6.2.1.15 Object 1014h: COB-ID for Emergency Message (DS301)

This object defines the COB-ID of the Emergency message.

Index	1014h
Name	COB-ID emergency message
Object code	VAR
Data type	UNSIGNED32
Category	conditional; mandatory, if Emergency is supported
Access	R/O
PDO mapping	not possible
Value range	UNSIGNED32
Default value	80h + Node - ID

6.2.1.16 Object 1016h: Consumer Heartbeat Time

The consumer heartbeat time defines the expected heartbeat cycle time (ms) and must be higher than the corresponding producer heartbeat time configured on the device producing this heartbeat. Monitoring starts after the reception of the first heartbeat. If the consumer heartbeat time is 0 ms the corresponding entry is not used.

Index	1016h
Name	consumer heartbeat time
Object code	ARRAY
Data type	UNSIGNED32
Category	optional

Subindex	0
Description	highest sub-index supported
Data type	UNSIGNED8
Category	mandatory
Access	R/O
PDO Mapping	not possible
Value range	1
Default value	1

Subindex	1
Description	Consumer heartbeat time
Category	mandatory
Access	R/W
PDO Mapping	not possible
Value range	unsigned 32
Default value	0

Definition of the entry value of Subindex 1

	MSB				LSB
Value	reserved (value: 00)		Node-ID		heartbeat time
Encoded as	-		UNSIGNED8		UNSIGNED16
Bit	31	24	23	16	15 0

6.2.1.17 Object 1017h: Producer Heartbeat Time

The producer heartbeat time defines the cycle time of the heartbeat in ms. If it's 0, it is not used.

Index	1017h
Name	Producer heartbeat time
Object code	VAR
Data type	UNSIGNED16
Category	conditional; mandatory, if guarding is not supported
Access	R/W
PDO mapping	not possible
Value range	UNSIGNED16
Default value	0

6.2.1.18 Object 1018h: Identity Object (DS301)

The Identity Object contains general device information.

Index	1018h
Name	Identity Object
Object code	RECORD
Data type	Identity
Category	mandatory
Subindex	0
Description	highest sub-index supported
Data type	UNSIGNED8
Category	mandatory
Access	R/O
PDO mapping	not possible
Value range	1 to 4
Default value	4

Subindex 1 is a unique number for a device manufacturer.

Subindex	1
Description	Vendor ID
Category	mandatory
Access	R/O
PDO mapping	not possible
Value range	UNSIGNED32
Default value	0x6Ah (Kollmorgen)

Subindex 2 contains four ASCII - characters, which determine the voltage range and current class of the device. The voltage range is one character L, M or H for low, medium and high voltage. The next three characters are showing the continuous current of the drive.

Subindex	2
Description	Product Code
Category	optional
Access	R/O
PDO mapping	not possible
Value range	e.g. M006 for an MV6 drive
Default value	no

Subindex 3 consists of two revision numbers:

- the major revision number in the upper word containing the CAN-version
- the minor revision number is not used in the AKD. The firmware version can be retrieved as a string via object 0x100A or as numbers via object 0x2018 subindex 1 to 4.

E.g. a value of 0x0014 0000 means CAN-version 0.20.

Subindex	3
Description	Revision Number
Category	optional
Access	R/O
PDO mapping	not possible
Value range	UNSIGNED32
Default value	no

Subindex 4 gives the serial number of the drive. This number contains the following information in it:

- bits 0..14: Board serial number (production in week of year)
- bits 15..20: week of production
- bits 21..24: year of production - 2009
- bits 25..31: ASCII-code of MFR-ID

Subindex	4
Description	Serial Number
Category	optional
Access	R/O
PDO mapping	not possible
Value range	UNSIGNED32
Default value	no

6.2.1.19 Object 1026h: OS Prompt

The OS prompt is used to build up an ASCII - communication channel to the drive.

Index	1026h
Name	OS Prompt
Object code	ARRAY
Data type	UNSIGNED8
Category	optional

Subindex	0
Description	highest sub-index supported
Data type	UNSIGNED8
Category	mandatory
Access	R/O
PDO mapping	not possible
Value range	2
Default value	2

Subindex 1 is used to send one character to the drive.

Subindex	1
Description	StdIn
Category	mandatory
Access	W
PDO mapping	not possible
Value range	UNSIGNED8
Default value	—

Subindex 2 is used to receive one character from the drive.

Subindex	2
Description	StdOut
Category	mandatory
Access	R/O
PDO mapping	not possible
Value range	UNSIGNED8
Default value	0

6.2.2 Manufacturer specific objects

6.2.2.1 Object 2000h: System Warnings

This object is used to show up to three actual warnings with their AKD- specific warning number.

Index	2000h
Name	System Warnings
Object code	ARRAY
Data type	UNSIGNED32
Subindex	0
Description	highest sub-index supported
Category	mandatory
Access	R/O
PDO mapping	not possible
Value range	3
Default value	3
Subindex	1 to 3
Description	DRV.WARNING1 to DRV.WARNINGS3
Mode	independent
Access	R/O
PDO mapping	not possible
Unit	—
Value range	0 to 999
Default value	0

6.2.2.2 Object 2001h: System Faults

This object is used to show up to ten actual faults with their AKD- specific fault number.

Index	2001h
Name	System Faults
Object code	ARRAY
Data type	UNSIGNED8
Subindex	0
Description	highest sub-index supported
Category	mandatory
Access	R/O
PDO mapping	not possible
Value range	0xA
Default value	0xA
Subindex	1 to A
Description	DRV.FAULT1 to DRV.FAULT10
Mode	independent
Access	R/O
PDO mapping	not possible
Unit	—
Value range	0 to 999
Default value	0

6.2.2.3 Object 2002h: Manufacturer status bytes

This objects delivers the information of the manufacturer status (object 0x1002 sub 0) as four separate, mappable, bytes.

Index	2002h
Name	Manufacturer status bytes
Object code	ARRAY
Data type	UNSIGNED8
Subindex	0
Description	highest sub-index supported
Category	mandatory
Access	R/O
PDO mapping	not possible
Value range	0x4
Default value	0x4
Subindex	1 to 4
Description	Manufacturer status byte 1 to Manufacturer status byte 4
Mode	independent
Access	R/O
PDO mapping	possible
Unit	—
Value range	0 to 0xFF
Default value	-

6.2.2.4 Object 2011h: DRV.RUNTIME in seconds

This object delivers the runtime of the drive in seconds.

Index	2011h
Name	DRV.RUNTIME in seconds
Object code	VAR
Data type	UNSIGNED32
Access	R/O
Unit	—
Value range	UNSIGNED32
Default value	0

6.2.2.5 Object 2012h: Fault history: Fault numbers

This object delivers the 20 latest entries of the fault numbers of the fault history table. The latest event can be read via sub-index 1. With new events the list is shifted to higher sub-indices.

Index	2012h
Name	Fault history: Fault numbers
Object code	ARRAY
Data type	UNSIGNED32
Subindex	0
Description	highest sub-index supported
Category	mandatory
Access	R/O
PDO mapping	not possible
Value range	0x14h
Default value	0x14h
Subindex	1 to 20
Description	Nth-latest entry in fault number list of fault history table (DRV.FAULTHIST)
Mode	independent
Access	R/O
PDO mapping	not possible
Unit	—
Value range	0 - 999
Default value	0

6.2.2.6 Object 2013h: Fault history: Time stamps

This object delivers the 20 latest entries of the fault time stamps of the fault history table in seconds related to DRV.RUNTIME. The latest event can be read via sub-index 1. With new events the list is shifted to higher sub-indices.

Index	2013h
Name	Fault history: Time stamps
Object code	ARRAY
Data type	UNSIGNED32
Subindex	0
Description	highest sub-index supported
Category	mandatory
Access	R/O
PDO mapping	not possible
Value range	0x14h
Default value	0x14h
Subindex	1 to 20
Description	Nth-latest entry in fault time stamp list of fault history table (DRV.FAULTHIST)
Mode	independent
Access	R/O
PDO mapping	not possible
Unit	—
Value range	UNSIGNED32
Default value	—

6.2.2.7 Object 2014-2017h: 1st-4th Mask 1 to 4 for Transmit-PDO

In order to reduce the bus loading with event-triggered PDOs, masking can be used to switch off the monitoring for individual bits in the PDO. In this way it can be arranged, for instance, that actual position values are only signaled once per turn.

This Object masks the PDO-channels 1 to 4. If only two bytes have been defined in a PDO, then it masks just two bytes, although 4 bytes of mask information have been transmitted.

An activated bit in the mask means that monitoring is active for the corresponding bit in the PDO.

Index	2014h 2015h 2016h 2017h
Name	tx_mask 1 to 4
Object code	ARRAY
Data type	UNSIGNED32
Subindex	1
Description	tx_mask1 to 4_low
Mode	independent
Access	R/W
PDO mapping	not possible
Unit	—
Value range	UNSIGNED32
Default value	FFFFFFFFh
Subindex	2
Description	tx_mask1 to 4_high
Mode	independent
Access	R/W
PDO mapping	not possible
Unit	—
Value range	UNSIGNED32
Default value	FFFFFFFFh

6.2.2.8 Object 2018h: Firmware Version

This object gives all information regarding the firmware version.

Example: Firmware version M_01_00_01_005 would show the numbers 1, 0, 1, 5 in the sub-indices 1 to 4.

Index	2018h
Name	firmware version
Object code	ARRAY
Data type	UNSIGNED16
Subindex	1
Description	major version
Mode	independent
Access	R/O
PDO mapping	not possible
Unit	—
Value range	UNSIGNED16
Default value	0
Subindex	2
Description	minor version
Mode	independent
Access	R/O
PDO mapping	not possible
Unit	—
Value range	UNSIGNED16
Default value	0
Subindex	3
Description	revision
Mode	independent
Access	R/O
PDO mapping	not possible
Unit	—

Default value	0
Subindex	4
Description	branch revision
Mode	independent
Access	R/O
PDO mapping	not possible
Unit	—
Value range	UNSIGNED16
Default value	0

6.2.2.9 Object 2026h: ASCII Channel

This object is used to build up an ASCII - communication channel to the drive with 4-byte ASCII-strings.

Index	2026h
Name	ASCII Channel
Object code	ARRAY
Data type	Visible String
Category	optional

Subindex	0
Description	highest sub-index supported
Data type	UNSIGNED8
Category	mandatory
Access	R/O
PDO mapping	not possible
Value range	2
Default value	2

Subindex 1 is used to send four ASCII-characters to the drive.

Subindex	1
Description	Command
Category	mandatory
Access	wo
PDO mapping	no
Value range	Visible String
Default value	—

Subindex 2 is used to receive four characters from the drive.

Subindex	2
Description	Response
Category	mandatory
Access	R/O
PDO mapping	no
Value range	Visible String
Default value	-

6.2.2.10 Object 20A0h: Latch position 1, positive edge

This object is used to output the position or a time, depending on CAP0.MODE, at which the first positive edge occurred on a signal, which can be configured with CAP0.TRIGGER. The latch enable must be active for that purpose(see object 20A4 and 20A5). With CAP0.MODE = 3 the latched position of the encoder index pulse is transferred via this object.

Index	20A0h
Name	Latch position 1 positive edge CAP0.PLFB, Time capture CAP0.T

6.2.2.18 Object 20B8h: Reset of changed input information

This object is used in PDOs to reset the state change information for the digital inputs shown in the Bits 24 to 30 in the object 60FD. Bit 0 to 6 are used to reset the information of the digital input 1 to 7.

Index	20B8h
Name	Reset of changed input information
Object code	VAR
Data type	UNSIGNED16
Category	optional
Access	rw
PDO mapping	possible
Value range	UNSIGNED16
Default value	0

6.2.2.19 Object 345Ah: Brake Control

These objects implement the possibility to control the brake directly overriding the drive logic. When the brake state is controlled by the fieldbus, the drive state (enabled, disabled, faulted) has no effect on the brake so the fieldbus is in control.

NOTICE

Applying or releasing the brake at the wrong time can be a safety hazard and can destroy your mechanic as well as drive or motor. Unexpected behaviour might be possible. It is the responsibility of the customer using this mode to use this function appropriately.

When fieldbus control is disabled, the drive controls the brake as defined by existing AKD brake related parameters. When fieldbus control is enabled, the Brake Command received over the fieldbus takes effect. If the Brake Command is set to APPLY and the current state is RELEASE, the brake begins to apply.

The default value of the fieldbus control is disabled so the drive is always in control until the fieldbus is operational. It is recommended that this bit remain 0 except for special operating conditions where the fieldbus will control the brake. When fieldbus communication is lost, the drive will regain control of the brake if the fieldbus had previously taken control.

Enable Fieldbus Control	Serious Failure condition present	Brake Command	Fieldbus Control Status	Controlled by...	Final Brake State
0	x	x	0	Drive	Drive
1*	no	0	1	Fieldbus	Applied
1*	no	1	1	Fieldbus	Released
x	yes	any	0	Drive	Drive

1* indicates that a rising edge was seen since the last time the drive applied the brake

Index	345Ah
Name	Brake Control
Object code	ARRAY
Data type	UNSIGNED16
Category	optional

Defined sub-indices

Subindex	0
Name	highest sub-index supported
Data type	UNSIGNED8
Category	mandatory
Access	R/O
PDO Mapping	not possible
Value Range	2
Default Value	2

Subindex	1
Name	Brake Control Command
Category	optional
Access	R/W
PDO Mapping	possible
Value Range	UNSIGNED16
Default Value	0

With subindex 1 the brake is controlled. Bit definition:

Bit	Name	Description
0	Enable fieldbus control	0 - brake is not controlled via this object 1 - enable fieldbus control via this object. This function works edge triggered, i.e. this bit has to have a 0 -> 1 transition to activate the brake control functionality. After a fault the functionality is reset and has to be activated again. The activation can be controlled by subindex 2 bit 0.
1	Brake Command	This command bit is only active, if the functionality was activated via bit 0. The function is as follows: 0 - apply the brake 1 - release the brake

Subindex	2
Name	Brake Status Response
Category	optional
Access	R/O
PDO Mapping	possible
Value Range	UNSIGNED16
Default Value	0

With subindex 2 the brake status can be checked. Bit definition:

Bit	Name	Description
0	Fieldbus control Status	0 - brake control via 0x345A is disabled or not possible due to drive failure. 1 - enable fieldbus control via this object. This function works edge triggered, i.e. this bit has to have a 0 -> 1 transition to activate the brake control functionality. After a fault the functionality is reset and has to be activated again. The activation can be controlled by subindex 2 bit 0.
1	Brake Status	0 - apply the brake 1 - release the brake Note: When the brake is applied or released, there is a time delay MOTOR.TBRAKEAPP or MOTOR.TBRAKEREL, after the receipt of the command before this status bit changes. The status is always reported: it is not affected by fieldbus control.
2	STO Status	0 - STO is not active (drive may be enabled) 1 - STO is active (drive can not be enabled)
3	HW Enable Status	0 - HW enable is disabled, drive function can not be enabled 1 - HW enable is enabled, drive function can be enabled

6.2.2.20 Object 3474h: Parameters for digital inputs

This set of objects is used to set extended parameters for some digital input functions. The parameters can be used for different DINx.MODEs. Therefore the scaling might be different or no scaling is used at all.

Two subindices build an access object to one of these parameters, because they are 64-bit numbers internally, e.g. object 3474 sub 1 gives access to the low 32 bits of DIN1.PARAM whereas 3474 sub 8 gives access to the high 32 bits.

If access to the whole 64 bit number is needed the higher bits must be written first. The access to the lower 32 bits then writes the parameter. If the to be written value fits into 32 bit, only the lower part needs to be written. The most-significant bit is then taken as sign-bit for the number.

Index	3474h
Name	DINx.PARAM

Access	R/W
PDO mapping	not possible
Value range	UNSIGNED32
Default value	0
Subindex	8 to 0xE
Description	DINx.PARAM high 32 bits, x = 1 .. 7
Category	optional
Access	R/W
PDO mapping	not possible
Value range	UNSIGNED32
Default value	0

6.2.2.21 Object 3475h: Parameters for digital outputs

This set of objects is used to set extended parameters for some digital output functions. The parameters can be used for different DOUTx.MODEs. Therefore the scaling might be different or no scaling is used at all.

Two subindices build an access object to one of these parameters, because they are 64-bit numbers internally, e.g. object 3475 sub 1 gives access to the low 32 bits of DOUT1.PARAM whereas 3475 sub 3 gives access to the high 32 bits.

If access to the whole 64 bit number is needed the higher bits must be written first. The access to the lower 32 bits then writes the parameter. If the to be written value fits into 32 bit, only the lower part needs to be written. The most-significant bit is then taken as sign-bit for the number.

Index	3475h
Name	DOUTx.PARAM
Object code	Array
Data type	UNSIGNED32

Category	optional
Access	R/W
PDO mapping	not possible
Value range	UNSIGNED32
Default value	0
Subindex	3 to 4
Description	DOUTx.PARAM high 32 bits, x = 1 .. 2
Category	optional
Access	R/W
PDO mapping	not possible
Value range	UNSIGNED32
Default value	0

6.2.2.22 Object 3496h: Fieldbus synchronization parameters

This set of objects is used to set or read parameters for the fieldbus synchronization used in the interpolated position mode (7) and the cyclic-modes 8 etc. The synchronization between a fieldbus master and the AKD is similar in all the supported fieldbus systems.

The AKD internal 16[kHz] interrupt function is responsible for calling the PLL function. This PLL function is called once per fieldbus cycle (set by object 60C2 sub 1 and 2). If the fieldbus sample period is for example 1[ms], the PLL code is called every 16th time of the 16[kHz] IRQ of the AKD.

Once in a fieldbus sample the SYNC-telegram must arrive, which resets a PLL counter in the Drive. After some time the already mentioned PLL function is called and reads back the time from that PLL counter.

Depending on the measured time the PLL function extends (in case that the measured time is too low) or lowers (in case that the measured time is too high) the sample time of the upcoming 16[kHz] tasks for one fieldbus sample by a selectable value (object 3496 sub 4) in order to move the PLL function closer to the expected distance (object 3496 sub 1).

Beside the objects mentioned here the parameter FBUS.SAMPLEPERIOD is important, which is set by object 60C2 sub 1 and 2. This setting is required in order to share the fieldbus sample time with the slave. This information is e.g. needed for being able to call the AKD internal PLL function once per fieldbus sample.

Index	3496h
Name	FBUS synchronization parameters
Object code	Array
Data type	UNSIGNED32
Category	optional

Subindex	0
Description	highest sub-index supported
Category	mandatory
Access	R/O
PDO mapping	not possible
Value range	0x4
Default value	0x4

Subindex	1
Description	FBUS.SYNCDIST
Category	optional
Access	R/W
PDO mapping	not possible
Value range	UNSIGNED32
Default value	320000 [ns]

Sub 1 is the expected time distance in nano seconds between clearing the PLL counter and calling the PLL function.

Subindex	2
Description	FBUS.SYNCACT
Category	optional
Access	R/W
PDO mapping	not possible
Value range	UNSIGNED32
Default value	320000 [ns]

Sub 2 is the actual time distance in nano seconds between clearing the PLL counter and calling the PLL function.

Subindex	3
Description	FBUS.SYNCWND
Category	optional
Access	R/W
PDO mapping	not possible
Value range	UNSIGNED32
Default value	70000 [ns]

Sub 3 is a window, which is used in order to consider the drive as being synchronized. The AKD is considered as synchronized in the following case:

$$FBUS.SYNCDIST - FBUS.SYNCWND < FBUS.SYNCACT < FBUS.SYNCDIST + FBUS.SYNCWND$$

Subindex	4
Description	FBUS.COMPTIME
Category	optional
Access	R/W
PDO mapping	not possible
Value range	UNSIGNED32
Default value	150 [ns]

Sub 4 value indicates the time, which is used for extending or lowering the sample rate of the AKD internal 16[kHz] IRQ, which is responsible for calling the PLL function. The default sample time is $32 * 1/16[\text{kHz}] = 2[\text{ms}]$.

The sample time of the AKD high prior interrupt is determined by $62.5[\mu\text{s}] - FBUS.COMPTIME$ if $FBUS.SYNCACT > FBUS.SYNCDIST$.

The sample time of the AKD high prior interrupt is determined by $62.5[\mu\text{s}] + FBUS.COMPTIME$ if $FBUS.SYNCACT < FBUS.SYNCDIST$.

6.2.3 Profile specific objects

6.2.3.1 Object 60B8h: Touch probe function

This object indicates the configured function of the touch probe.

Index	60B8h
Name	Touch probe function
Object code	Variable
Data type	UNSIGNED16
Category	optional
Access	R/W
PDO Mapping	yes
Value range	UNSIGNED16
Default value	0

Definition of the possible functions:

Bit	Value	Meaning
0	0	Switch off touch probe 1
	1	Enable touch probe 1
1	0	Trigger first event
	1	Continuous
3, 2	00b*	Trigger with touch probe 1 input
	01b	Trigger with zero impulse signal or position encoder
	10b	Touch probe source as defined in object 60D0h, sub-index 01h
	11b	reserved
4	0	Switch off sampling at positive edge of touch probe 1
	1	Enable sampling at positive edge of touch probe 1
5	0	Switch off sampling at negative edge of touch probe 1
	1	Enable sampling at negative edge of touch probe 1
6, 7	-	User-defined (e.g. for testing)
8	0	Switch off touch probe 2
	1	Enable touch probe 2
9	0	Trigger first event
	1	continuous
11, 10	00b	Trigger with touch probe 2 input
	01b	Trigger with zero impulse signal or position encoder
	10b	Touch probe source as defined in object 60D0h, sub-index 02h
	11b	reserved
12	0	Switch off sampling at positive edge of touch probe 2
	1	Enable sampling at positive edge of touch probe 2
13	0	Switch off sampling at negative edge of touch probe 2
	1	Enable sampling at negative edge of touch probe 2
14, 15	-	User-defined (e.g. for testing)

* b = binary

If both edges are selected at the same time (bit 4=1 and bit 5=1 for probe 1 or bit 12=1 and bit 13=1 for probe 2), the first edge (positive or negative) triggers the probe function. The position, latched at this edge, is taken over for both edges (positive and negative).

6.2.3.2 Object 60B9h: Touch probe status

This object indicates the status of the touch probe.

Index	60B9h
Name	Touch probe status
Object code	Variable
Data type	UNSIGNED16
Category	optional
Access	R/O
PDO Mapping	yes
Value range	UNSIGNED16
Default value	0

Definition of the status:

Bit	Value	Meaning
0	0	Touch probe 1 is switched off
	1	Touch probe 1 is enabled
1	0	Touch probe 1 no positive edge value stored
	1	Touch probe 1 positive edge position stored
2	0	Touch probe 1 no negative edge value stored
	1	Touch probe 1 negative edge position stored
3 to 5	0	reserved
6, 7	-	User-defined (e.g. for testing)
8	0	Touch probe 2 is switched off
	1	Touch probe 2 is enabled
9	0	Touch probe 2 no positive edge value stored
	1	Touch probe 2 positive edge position stored
10	0	Touch probe 2 no negative edge value stored
	1	Touch probe2 negative edge position stored
11 to 13	0	reserved
14, 15	-	User-defined (e.g. for testing)

6.2.3.3 Object 60BAh: Touch probe 1 positive edge

This object provides the position value of the touch probe 1 at positive edge.

Index	60BAh
Name	Touch probe 1 positive edge
Object code	Variable
Data type	INTEGER32
Category	optional
Access	R/O
PDO Mapping	yes
Value range	INTEGER32
Default value	no

6.2.3.4 Object 60BBh: Touch probe 1 negative edge

This object provides the position value of the touch probe 1 at negative edge.

Index	60BBh
Name	Touch probe 1 negative edge
Object code	Variable
Data type	INTEGER32
Category	optional
Access	R/O
PDO Mapping	yes
Value range	INTEGER32
Default value	no

6.2.3.5 Object 60BCh: Touch probe 2 positive edge

This object provides the position value of the touch probe 2 at positive edge.

Index	60BCh
Name	Touch probe 2 positive edge
Object code	Variable
Data type	INTEGER32
Category	optional
Access	R/O
PDO Mapping	yes
Value range	INTEGER32
Default value	no

6.2.3.6 Object 60BDh: Touch probe 2 negative edge

This object provides the position value of the touch probe 2 at negative edge.

Index	60BDh
Name	Touch probe 2 negative edge
Object code	Variable
Data type	INTEGER32
Category	optional
Access	R/O
PDO Mapping	yes
Value range	INTEGER32
Default value	no

6.2.3.7 Object 60D0h: Touch probe source

This object provides the source of the touch probe function, when the dedicated bits 2/3 or 10/11 of the touch probe function (object 60B8h) are set accordingly.

Index	60D0h
Name	Touch probe source
Object code	Array

manufacturer specific		reserved		cstca	cst	csv	csp	ip	hm	reserved	tq	pv	vl	pp
MSB														LSB

6.3 PDO Configuration

PDOs are used for process data communication.

There are two types of PDOs: Receive PDOs (RPDOs) and transmit PDOs (TPDOs).

The content of the PDOs is pre-defined (→ p. 85 and → p. 88). If the data content is not appropriate for a special application the data objects in the PDOs can be remapped freely.

One data entry in the PDOs looks like this:

MSB		LSB
index (16 bit)	Subindex (8 bit)	data length in bits (8 bit)

The configuration procedure for a free mapping of a PDO looks like this (example for TPDO1):

1. Stop possible transmission of the PDO.

COB-ID	Control byte	Index		Sub-index	Data	Comment
		Low byte	High byte			
601	23	00	18	01h	81 01 00 C0	Switch-off COB-Id

2. Delete the actual mapping of the PDO by writing a 0 to the subindex 0 of the mapping Object.

COB-ID	Control byte	Index		Sub-index	Data	Comment
		Low byte	High byte			
601	2F	00	1A	00h	00 00 00 00	Delete actual mapping

3. Build the mapping with object dictionary objects (→ p. 133) which are mappable, e.g.

COB-ID	Control byte	Index		Sub-index	Data	Comment
		Low byte	High byte			
601	23	00	1A	01h	10 00 41 60	1st entry: CANopen statusword with 16 bits
601	23	00	1A	02h	20 00 02 10	2nd entry: Manufacturer status with 32 bits

4. Write the number of mapped objects to subindex 0 of the mapping Object.

COB-ID	Control byte	Index		Sub-index	Data	Comment
		Low byte	High byte			
601	2F	00	1A	00h	02 00 00 00	Check for the right highest sub-index sup- ported

Mapping shall be done before the network management is switched to OPERATIONAL.

6.3.1 Receive PDOs (RXPDO)

Four Receive PDOs can be configured in the drive:

- configuration of the communication (Objects 1400-1403h)
- configuration of the PDO-contents (mapping, Objects 1600-1603h)

6.3.1.1 Objects 1400-1403h: 1st - 4th RxPDO communication parameter (DS301)

1400h to 1403h for RxPDO 1 to 4

Index	1400h 1401h 1402h 1403h
Name	receive PDO parameter
Object code	RECORD
Data type	PDO CommPar
Category	mandatory

Defined sub-indices

Subindex	0
Name	highest sub-index supported
Data type	UNSIGNED8
Category	mandatory
Access	R/O
PDO Mapping	not possible
Value Range	2
Default Value	2

Subindex	1
Name	COB-ID used by PDO
Category	mandatory
Access	R/W
PDO Mapping	not possible
Value Range	UNSIGNED32
Default Value	Index 1400h: 200h + Node-ID Index 1401h: 300h + Node-ID Index 1402h: 400h + Node-ID Index 1403h: 500h + Node-ID

Subindex 1 contains the COB-Id of the PDO as a bit coded information:

Bit	Value	Meaning
31	0	PDO exists/is valid
	1	PDO does not exist/is not valid
30	0	RTR allowed on this PDO, not to be used (Can in Automation organisation)
	1	RTR not allowed on this PDO
29	0	11 bit-ID (CAN 2.0A)
	1	29 bit-ID (CAN 2.0B), not supported
28 to 11	X	Identifier-bits with 29 bit-ID, not relevant
10 to 0	X	Bits 10-0 of COB-ID

Subindex	2
Name	transmission type
Category	mandatory
Access	R/W
PDO Mapping	not possible
Value Range	UNSIGNED8
Default Value	FFh

Subindex 2 contains the transmission type of the PDO. There are two ways of setting:

- the value FFh or 255 for event-triggered PDO, which is directly interpreted by reception and taken into actions,
- values from 0 to 240, which cause a SYNC-telegram-controlled interpretation of the PDO contents. Values of 1 to 240 mean, that 0 to 239 SYNC-telegrams are ignored, before one is interpreted. The value 0 means that only the next SYNC-telegram is interpreted.

6.3.1.2 Objects 1600-1603h: 1st - 4th RxPDO mapping parameter (DS301)

1600h to 1603h for RxPDO 1 to 4.

Index	1600h 1601h 1602h 1603h

Name	PDO - mapping for the n-th application object
Category	Conditional, depends on number and size of object be mapped
Access	R/W
PDO Mapping	not possible
Value Range	UNSIGNED32
Default Value	See below

6.3.1.3 Default RXPDO definition

RXPDO 1:

Subindex	Value	Meaning
0	1	One PDO-mapping entry
1	60 40 00 10	Control word

RXPDO 2:

Subindex	Value	Meaning
0	2	Two PDO-mapping entries
1	60 40 00 10	Control word
2	60 60 00 08	Modes of Operation

RXPDO 3:

Subindex	Value	Meaning
0	2	Two PDO-mapping entries
1	60 40 00 10	Control word
2	60 7A 00 20	Target Position (Mode PP)

RXPDO 4:

Subindex	Value	Meaning
0	2	Two PDO-mapping entries
1	60 40 00 10	Control word
2	60 FF 00 20	Target Velocity (Mode PV)

6.3.2 Transmit PDOs (TXPDO)

Four Transmit PDOs can be configured in the drive:

- configuration of the communication (Objects 1800-1803h)
- configuration of the PDO-contents (mapping, Objects 1A00-1A03h)

6.3.2.1 Objects 1800-1803h: 1st - 4th TxPDO communication parameter (DS301)

1800h to 1803h for TxPDO 1 to 4.

Index	1800h 1801h 1802h 1803h
Name	transmit PDO parameter
Object code	RECORD
Data type	PDO CommPar
Category	mandatory
Subindex	0
Name	highest sub-index supported
Data type	UNSIGNED8
Category	mandatory
Access	R/O
PDO Mapping	not possible
Value Range	5
Default Value	5
Subindex	1
Name	COB-ID used by PDO
Category	mandatory
Access	R/W
PDO Mapping	not possible
Value Range	UNSIGNED32
Default Value	Index 1800h: 180h + Node-ID Index 1801h: 280h + Node-ID Index 1802h: 380h + Node-ID Index 1803h: 480h + Node-ID
Subindex	2
Name	transmission type
Category	mandatory
Access	R/W
PDO Mapping	not possible
Value Range	UNSIGNED8
Default Value	FFh
Subindex	3
Name	inhibit time
Category	optional
Access	R/W
PDO Mapping	not possible
Value Range	UNSIGNED16 (n*1/10ms)
Default Value	0h

Subindex	4
Name	reserved
Category	optional
Access	R/W
PDO Mapping	not possible
Value Range	0
Default Value	0

Subindex	5
Name	event timer
Category	optional
Access	R/W
PDO Mapping	not possible
Value Range	UNSIGNED 16 (0=not used, ms)
Default Value	0h

Subindex 1 contains the COB-Id of the PDO as a bit coded information:

Bit-Number	Value	Meaning
31	0	PDO exists/is valid
	1	PDO does not exist/is not valid
30	0	RTR allowed on this PDO, not supported
	1	RTR not allowed on this PDO, not supported
29	0	11 bit-ID (CAN 2.0A)
	1	29 bit-ID (CAN 2.0B), not supported
28 to 11	X	Identifier-bits with 29 bit-ID, not relevant
10 to 0	X	Bits 10-0 of COB-ID

Subindex 2 contains the transmission type of the PDO. There are two ways of setting:

- A value of FFh or 255d for an event-triggered PDO, which is sent immediately after a change in the mapped application objects. Setting of Subindex 3 or 5 has an influence on the sending of a PDO. With Subindex 3 you can configure, in which minimal time the so configured Transmit-PDOs are sent, if PDO-data contents change (reduction of bus-load). With Subindex 5 (event time) a timer is used, which is reset with every event-triggered sending of this PDO. If there is no change of the PDO-content in this time, the PDO is sent caused by this timer event.
- Values from 0 to 240 cause a SYNC-Telegram controlled sending of the PDO.
- Values from 1 to 240 define how often the SYNC-telegram leads to a sending of a PDO.
- The value 0 means, that only the next SYNC-telegram leads to a sending of the so configured PDOs.

6.3.2.2 Objects 1A00-1A03h: 1st - 4th TxPDO mapping parameter (DS301)

1A00h to 1A03h for TxPDO 1 to 4.

Default Value	PDO1: 1 PDO2: 2 PDO3: 2 PDO4: 2
Subindex	1 - 8
Name	PDO - mapping for the n-th application object
Category	Conditional, depends on number and size of object be mapped
Access	R/W
PDO Mapping	not possible
Value Range	UNSIGNED32
Default Value	See below

6.3.2.3 Default TXPDO definition

TXPDO 1:

Subindex	Value	Meaning
0	1	One PDO-mapping entry
1	60 41 00 10	Status word

TXPDO 2:

Subindex	Value	Meaning
0	2	Two PDO-mapping entries
1	60 41 00 10	Status word
2	60 61 00 08	Modes of Operation display

TXPDO 3:

Subindex	Value	Meaning
0	2	Two PDO-mapping entries
1	60 41 00 10	Status word
2	60 64 00 20	Position actual value

TXPDO 4:

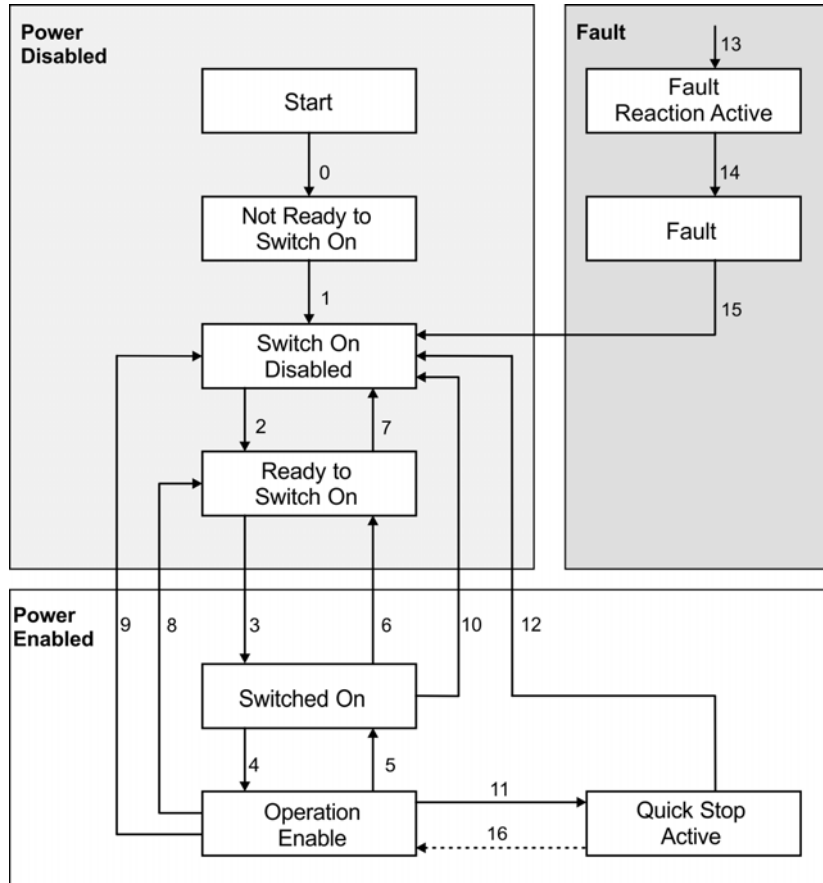

Subindex	Value	Meaning
0	2	Two PDO-mapping entries
1	60 41 00 10	Status word
2	60 6C 00 20	Velocity actual value

6.4 Device Control (dc)

The device control of the AKD can be used to carry out all the motion functions in the corresponding modes. The control of the AKD is implemented through a mode-dependent state machine. The state machine is controlled through the control word (→ p. 94).

The mode setting is made through the object "Modes of Operation" (→ p. 98). The states of the state machine can be revealed by using the status word (→ p. 95).

6.4.1 State Machine (DS402)

6.4.1.1 States of the State Machine

State	Description
Not Ready for Switch On	AKD is not ready to switch on, there is no operational readiness (BTB/RTO) signaled from the controller program.
Switch On Disable	AKD is ready to switch on, parameters can be transferred, the DC-link voltage can be switched on, motion functions cannot be carried out yet.
Ready to Switch On	DC-link voltage may be switched on, parameters can be transferred, motion functions cannot be carried out yet.
Switched On	DC-link voltage must be switched on, parameters can be transferred, motion functions cannot be carried out yet, output stage is switched on (enabled).
Operation Enable	No fault present, output stage and motion functions are enabled.
Quick Stop Active	Drive has been stopped with the emergency ramp, output stage is enabled, motion functions are not enabled.
Fault Reaction Active	A fault has occurred, the drive is stopped with the quickstop ramp.
Fault	A fault is active, the drive has been stopped and disabled.

6.4.1.2 Transitions of the state machine

The state transitions are affected by internal events (e.g. switching off the DC-link voltage) and by the flags in the control word (bits 0,1,2,3,7).

Transition	Event	Action
0	Reset	Initialization
1	Initialization completed successfully. AKD is ready to operate.	none
2	Bit 1 Disable Voltage and Bit 2 Quick Stop are set in the control word (Shutdown command). DC-link voltage may be present.	none
3	Bit 0 is also set (Switch On)	Output stage is switched on (enabled), provided that the hardware enable is present (logical AND). Drive has torque.
4	Bit 3 is also set (Enable Operation)	Motion function is enabled, depending on the mode that is set.
5	Bit 3 is canceled (Disable Operation)	Motion function is inhibited. Drive is stopped, using the relevant ramp (mode-dependent). The present position is maintained.
6	Bit 0 is canceled (Shutdown)	Output stage is disabled. Drive has no torque.
7	Bits 1 and 2 are canceled (Quick Stop/Disable Voltage)	none
8	Bit 0 is canceled (Shutdown)	Output stage is disabled. No torque.
9	Bit 1 is canceled (Disable Voltage)	Output stage is disabled. No torque.
10	Bits 1 and 2 are canceled (Quick Stop/Disable Voltage)	Output stage is disabled. No torque.
11	Bit 2 is canceled (Quick Stop)	Drive is stopped with the emergency braking ramp. The output stage remains enabled. Setpoints are canceled (motion block number, digital setpoint, speed for jogging or homing). Bit 2 must be set again to perform any further motion.
12	Bit 1 is canceled (Disable Voltage)	Output stage is disabled. No torque.
13	Fault reaction active	Execute appropriate fault reaction
14	Fault reaction is completed	Drive function is disabled. The power section may be switched off.
15	"Fault Reset" command received from host	A reset of the fault condition is carried out if no fault exists currently on the drive. After leaving the state Fault the Bit7 'Reset Fault' of the controlword must be cleared by the host.
16	Bit 2 is set	Motion function is enabled again.

NOTE

If the drive is operated through the control word/status word, then no control commands may be sent through another communication channel (ASCII channel, RS232).

6.4.2 Object Description

6.4.2.1 Object 6040h: Control word (DS402)

The control commands are built up from the logical combination of the bits in the control word and external signals (e.g enable output stage). The definitions of the bits are shown below:

Index	6040h
Name	control word
Object code	VAR
Data type	UNSIGNED16
Access	R/W
PDO mapping	possible
Unit	—
Value range	0 to 65535
EEPROM	no
Default value	0

Bit assignment in control word

Bit	Name	Bit	Name
0	Switch on	8	Pause/halt
1	Disable Voltage	9	reserved
2	Quick Stop	10	reserved
3	Enable Operation	11	reserved
4	Operation mode specific	12	reserved
5	Operation mode specific	13	Manufacturer-specific
6	Operation mode specific	14	Manufacturer-specific
7	Reset Fault (only effective for faults)	15	Manufacturer-specific

Commands in the control word

Command	Bit 7 Fault Reset	Bit 3 Enable Operation	Bit 2 Quick Stop	Bit 1 Disable Voltage	Bit 0 Switch on	Transitions
Shutdown	X	X	1	1	0	2, 6, 8
Switch on	X	X	1	1	1	3
Disable Voltage	X	X	X	0	X	7, 9, 10, 12
Quick Stop	X	X	0	1	X	7, 10, 11
Disable Operation	X	0	1	1	1	5
Enable Operation	X	1	1	1	1	4, 16
Fault Reset	1	X	X	X	X	15

Bits marked by an X are irrelevant.

Mode-dependent bits in the control word

The following table shows the mode-dependent bits in the control word. Only manufacturer-specific modes are supported at present. The individual modes are set by Object 6060_h Modes of operation.

Operation mode	No.	Bit 4	Bit 5	Bit 6
Profile Position Mode (pp)	01h	new_setpoint	change_set_immediately	absolute/relative
Profile Velocity Mode (pv)	03h	reserved	reserved	reserved
Profile Torque Mode (tq)	04h	reserved	reserved	reserved
Homing Mode (hm)	06h	homing_operation_start	reserved	reserved
Interpolated Position Mode (ip)	07h	Enable Interpolation	reserved	reserved
Cyclic sync position Mode (csp)	08h	reserved	reserved	reserved
Cyclic sync velocity mode (csv)	09h	reserved	reserved	reserved
Cyclic sync torque mode (cst)	0ah	reserved	reserved	reserved

Description of the remaining bits in the control word

The remaining bits in the control word are described below.

Bit 8 Pause If Bit 8 is set, then the drive halts (pauses) in all modes. The setpoints (speed for homing or jogging, motion task number, setpoints for digital mode) for the individual modes are retained.

Bit 9,10 These bits are reserved for the drive profile (DS402).

Bit 13, 14, 15 These bits are manufacturer-specific, and reserved at present.

6.4.2.2 Object 6041h: Status word (DS402)

The momentary state of the state machine can be read out with the aid of the status word.

Index	6041h
Name	Status word
Object code	VAR
Data type	UNSIGNED16
Access	R/W
PDO mapping	possible
Unit	—
Value range	0 to 65535
EEPROM	yes
Default value	0

Bit assignment in the status word

Bit	Name	Bit	Name
0	Ready to switch on	8	STO – Safe Torque Off
1	Switched on	9	Remote
2	Operation enabled	10	Target reached
3	Fault	11	Internal limit active
4	Voltage enabled	12	Operation mode specific (reserved)
5	Quick stop	13	Operation mode specific (reserved)
6	Switch on disabled	14	Manufacturer-specific (reserved)
7	Warning	15	Manufacturer-specific (reserved)

States of the state machine

State	Bit 6 switch on disabled	Bit 5 quick stop	Bit 3 fault	Bit 2 operation enabled	Bit 1 switched on	Bit 0 ready to switch on
Not ready to switch on	0	X	0	0	0	0
Switch on disabled	1	X	0	0	0	0
Ready to switch on	0	1	0	0	0	1
Switched on	0	1	0	0	1	1
Operation enabled	0	1	0	1	1	1
Fault	0	X	1	0	0	0
Fault reaction active	0	X	1	1	1	1
Quick stop active	0	0	0	1	1	1

Bits marked by X are irrelevant

Description of the remaining bits in the status word

Bit 4: voltage_enabled The DC-link voltage is present if this bit is set.

Bit 7: warning There are several possible reasons for Bit 7 being set and this warning being produced. The reason of a warning can be seen by the Error code of the Emergency message, which is sent on the bus caused by this warning.

Bit 9: The remote-bit is set by the telnet command FBUS.REMOTE. The default state is 1 indicating that the power stage shall be only controlled by the DS402 control word. For special actions via telnet like tuning or commutation finding, FBUS.REMOTE shall be set to 0 via telnet to inform the fieldbus master.

Bit 10: target_reached This is set when the drive has reached the target position. In profile position mode the position window is set via MT.TPOSWND, in homing mode via HOME.TPOSWND. If FBUS.PARAM05-bit 15 is set to 1. the Target Reached - bit is also set, when the drive comes to a standstill after the halt bit 8 of the control word was set.

Bit 11: internal_limit_active This bit specifies that a movement was or is limited. Bit 11 is set when one of the following warnings is set: n478, n107, n108, n154, n157, n158, n159, n160, n161, n163, n164, n165, n167, n168, n169, n170, n171, n174, n179, n135

Mode-dependent bits in the status word

The following table shows the mode-dependent bits in the status word. The individual modes are set by " Object 6060h: Modes of Operation (DS402)" (→ p. 98).

Operation mode	No.	Bit 12	Bit 13
Profile Position Mode (pp)	01h	setpoint acknowledge	following error
Homing Mode (hm)	06h	homing attained	homing error
Interpolated Position Mode (ip)	07h	ip mode active	following error
Cyclic sync position Mode (csp)	08h	This bit stays on 1 as long as the drive is following the position set-points.	following error
Cyclic sync velocity mode (csv)	09h	This bit stays on 1 as long as the drive is following the position set-points.	reserved
Cyclic sync torque mode (cst)	0ah	This bit stays on 1 as long as the drive is following the position set-points.	reserved

6.4.2.3 Object 605Ah: Quick stop option code (DS402)

This object defines the action, which is taken as quick stop function.

Index	605Ah
Name	Quick stop option code
Object code	VAR
Data type	INTEGER16
Category	optional
Access	R/W
PDO mapping	not possible
Value range	1, 2, 5, 6
Default value	2

Supported codes:

Bit	Description
1	Slow down on slow down ramp and transit into Switch On Disabled
2	Slow down on quick stop ramp and transit into Switch On Disabled
5	Slow down on slow down ramp and stay in Quick Stop Active
6	Slow down on quick stop ramp and stay in Quick Stop Active

6.4.2.4 Object 6060h: Modes of Operation (DS402)

This object is used to set the mode, which can be read out by Object 6061h. Two types of operating mode are used:

- manufacturer-specific operating modes
- operating modes as per CANopen drive profile DS402

These operating modes are defined in the CANopen drive profile DS402. After the mode has been changed, the corresponding setpoint must be set once more (for instance, the homing velocity in the mode homing_setpoint). If the position or jogging mode is stored, then the Homing mode is set after a RESET of the drive.

NOTE

An operating mode only becomes valid when it can be read by Object 6061h.

WARNING Automatic Restart!

Risk of death or serious injury for humans working in the machine. The drive could move unexpectedly. When the drive is enabled, a mode change is only permissible at zero speed.

- Never change the mode while the motor is running!
- Set the speed setpoint to 0 before changing over.

Index	6060h
Name	mode of operation
Object code	VAR
Data type	INTEGER8
Category	mandatory
Access	R/W
PDO mapping	possible
Value range	-3, -2, -1, 1, 3, 4, 6, 7, 8, 9, 10
Default value	—

Supported modes (negative values are manufacturer specific modes):

Value (hex)	Mode
-3	Electronic gearing mode
-2	Analog velocity mode
-1	Analog current mode
1	Profile position mode
3	Profile velocity mode
4	Profile torque mode
6	Homing mode
8	Cyclic synchronous position mode
9	Cyclic synchronous velocity mode
10	Cyclic synchronous torque mode

6.4.2.5 Object 6061h: Modes of Operation Display (DS402)

This object can be used to read the mode that is set by Object 6060h. An operating mode only becomes valid when it can be read by Object 6061h (see also Object 6060h).

Index	6061h
Name	mode of operation display
Object code	VAR
Data type	INTEGER8
Category	mandatory
Access	R/O
PDO mapping	possible
Value range	-3, -2, -1, 1, 3, 4, 6, 7, 8, 9, 10
Default value	—

6.5 Factor Groups (fg) (DS402)

The "factor groups" define the units of position-, velocity- and acceleration setpoints. These values are converted into drive-specific parameters.

Two types of scalings can be used depending on the configuration bit 4 in FBUS.PARAM05:

1. Scaling analog to Telnet. Then you should set the UNIT.PROTARY = 3, UNIT.VROTARY = 3 and UNIT.ACCROTARY = 3.
2. Scaling only with DS402 - scaling factors independent of the scalings used via Telnet. Therefore use the settings via the objects 204C / 6091/6092.

NOTE

The drive parameters for the unit definitions should be set as follows:

UNIT.PROTARY= 3 (UNIT.PIN/UNIT.POUT)
 UNIT.VROTARY = 3 (UNIT.PIN/UNIT.POUT/s)
 UNIT.ACCROTARY = 3 (c UNIT.PIN/UNIT.POUT/s²)

6.5.1 General Information

6.5.1.1 Factors

You can convert between physical dimensions and sizes, and the internal units used in the device (increments). Several factors can be implemented. This chapter describes how these factors influence the system, how they are calculated and which data are necessary to build them.

6.5.1.2 Relationship between Physical and Internal Units

The factors defined in the factor group set up a relationship between device-internal units (increments) and physical units.

The factors are the result of the calculation of two parameters called dimension index and notation index. The dimension index indicates the physical dimension, the notation index indicates the physical unit and a decimal exponent for the values. These factors are directly used to normalize the physical values.

The notation index can be used in two ways:

- For a unit with decimal scaling and notation index < 64, the notation index defines the exponent/decimal place of the unit.
- For a unit with non-decimal scaling and notation index > 64, the notation index defines the subindex of the physical dimension of the unit.

6.5.2 Objects for velocity scaling

6.5.2.1 Object 204Ch: PV Scaling Factor

This object shall indicate the configured numerator and denominator of the pv scaling factor. The pv scaling factor serves to modify the resolution or directing range of the specified set-point. It is also included in calculation of the vl velocity demand, and vl velocity actual value. It does not influence the velocity limit function and the ramp function. The value shall have no physical unit and shall be given in the range from -32 768 to +32 767, but the value of 0 shall not be used.

The velocity scaling factor is only active, when bit 4 of FBUS.PARAM05 is set to 1. Otherwise velocities are scaled as 1/1000 rpm.

Index	204Ch
Name	pv scaling factor

6.5.3 Objects for position calculation

6.5.3.1 Object 608Fh: Position encoder resolution (DS402)

The position encoder resolution defines the ratio of encoder increments per motor revolution on the CANopen end. Encoder increments are set either directly by subindex 1 (only powers of 2 available) or implicit by writing to the parameter FB1.PSCALE.

Index	608Fh
Name	Position encoder resolution
Object Code	ARRAY

6.5.4 Objects for additional feedback sensor systems

The AKD supports additional sensors for position control / surveillance.

6.5.4.1 Object 60E9h: Additional feed constant – feed

This object provides the feed for the additional feed constant calculation. This object shall be used with the corresponding subindex of the object 60EEh (driving shaft revolutions for the additional feed constant calculation). The value of the object 60E4h is calculated analog to the feed constant calculation for the actual position 6064h via object 6092h.

6.5.4.5 Object 60E4h: Additional position actual value

This object provides the additional position actual values. The values are given in user-defined position units. The value is calculated analog to the calculation for the actual position 6064h via object 6091h and 6092h, but for this with the factors given by the objects 60E8h, 60E9h, 60EDh and 60EEh.

None.

6.7.2 Object description

6.7.2.1 Object 2071h: Target Current

This parameter can be used alternatively to the DS402 parameter 6071h and is the input to the torque controller. The value is scaled in mA (milli Amperes).

Index	2071h
Name	Target current
Object code	VAR
Data type	INTEGER 32
Category	optional
Access	RW
PDO mapping	possible
Value range	depends on DRV.IPEAK and MOTOR.IPEAK
Default value	0

6.7.2.2 Object 2077h: Current Actual Value

This parameter can be used alternatively to the DS402 parameter 6077h. The value is scaled in mA (milli Amperes).

Index	2077h
Name	Current actual value
Object code	VAR
Data type	INTEGER 32
Category	optional
Access	RO
PDO mapping	possible
Value range	depends on DRV.IPEAK and MOTOR.IPEAK
Default value	0

6.7.2.3 Object 207Fh: Maximum Velocity

Maximum velocity This parameter limits the velocity of the motor in profile torque and cyclic synchronous torque mode. The scaling is the same as for object 60FFh.

Index	207Fh
Name	Maximum velocity
Object code	VAR
Data type	UNSIGNED32
Category	optional
Access	RW
PDO mapping	possible
Value range	
Default value	0, means no limitation

6.7.2.4 Object 6071h: Target torque (DS402)

This parameter is the input value for the torque controller in profile torque mode and the value is given per thousand (1‰) of rated torque.

Index	6071h
Name	Target torque
Object code	VAR
Data type	INTEGER16
Category	conditional; mandatory, if tq supported
Access	R/W
PDO mapping	possible
Value range	INTEGER16
Default value	0

6.7.2.5 Object 6073h: Max current (DS402)

This value represents the maximum permissible torque creating current in the motor and is given per thousand (1‰) of rated current.

Index	6073h
Name	Max current
Object code	VAR
Data type	UNSIGNED16
Category	optional
Access	R/W
PDO mapping	not possible
Value range	UNSIGNED16
Default value	0

6.7.2.6 Object 6077h: Torque actual value (DS402)

The torque actual value corresponds to the instantaneous torque in the drive motor. The value is given per thousand (1‰) of rated torque. This object reflects the actual current (DRV.ICONT).

Index	6077h
Name	Torque actual value
Object code	VAR
Data type	INTEGER16
Category	optional
Access	R/O
PDO mapping	possible
Value range	INTEGER16
Default value	0

6.7.2.7 Object 6087h Torque slope (DS402)

This object defines the rate of change of torque. The value is given in units of per thousand of rated torque per second. The minimum rate settable for the AKD is equivalent to the value of DRV.ICONT (= 1000 per mille) per ~ 420 milliseconds equivalent to a value of ~ 2385 per mille / second.

Index	6087h
Name	Torque slope
Object code	VAR
Data type	UNSIGNED32
Category	mandatory, if tq is supported
Access	R/W
PDO mapping	possible
Value range	UNSIGNED32
Default value	-

6.7.2.8 Object 60E0h: Positive Torque Limit Value

The object gives the configured maximum motor torque in positive direction. The value is given per thousand (1‰) of rated torque.

Index	60E0h
Name	Positive Torque Limit Value
Object code	Variable
Data type	UINTEGER16
Category	optional
Access	R/O
PDO Mapping	yes
Value range	UINTEGER16 (limited by DRV.IPEAK and MOTOR.IPEAK)
Default value	0

6.7.2.9 Object 60E1h: Negative Torque Limit Value

The object gives the configured maximum motor torque in negative direction. The value is given per thousand (1 ‰) of rated torque.

Index	60E1h
Name	Negative Torque Limit Value
Object code	Variable
Data type	UIINTEGER16
Category	optional
Access	R/O
PDO Mapping	yes
Value range	UIINTEGER16 (limited by DRV.IPEAK and MOTOR.IPEAK)
Default value	0

6.8 Position Control Function (pc) (DS402)

6.8.1 General Information

This section describes the actual position values that are associated with the position controller of the drive. They are used for the profile position mode.

6.8.1.1 Objects that are defined in this section

Index	Object	Name	Type	Access
6063h	VAR	position actual value*	INTEGER32	R
6064h	VAR	position actual value	INTEGER32	R
6065h	VAR	following error window	UNSIGNED32	R/W
60F4h	VAR	following error actual value	INTEGER32	R
60FCh	VAR	position demand internal value	INTEGER32	R

6.8.1.2 Objects that are defined in other sections

Index	Object	Name	Type	Section
607Ah	VAR	target position	INTEGER32	pp (→ p. 127)
607Ch	VAR	home-offset	INTEGER32	hm (→ p. 122)
607Dh	ARRAY	software position limit	INTEGER32	pp (→ p. 127)
6040h	VAR	control word	INTEGER16	dc (→ p. 94)
6041h	VAR	status word	UNSIGNED16	dc (→ p. 95)

6.8.2 Object Description

6.8.2.1 Object 6063h: position actual value* (DS402)

The object position actual value provides the momentary actual position in increments. If FB1.EXTENDEDMULTITURN is configured, the saved extended multiturn position will be returned

The resolution is defined with Object 608F as power-of-two number.

Index	6063h
Name	position actual value
Object code	VAR
Data type	INTEGER32
Mode	pc, pp
Access	R/W
PDO mapping	possible
Unit	increments (1 turn = $2^{FB1.PSCALE}$)
Value range	(-2^{31}) to $(2^{31}-1)$
Default value	2^{20}
EEPROM	no

6.8.2.2 Object 6064h: position actual value (DS402)

The object position actual value provides the actual position (PL.FB). If FB1.EXTENDEDMULTITURN is configured, the saved extended multiturn position will be returned. The resolution can be altered by the gearing factors of the position controller (Object 6091/6092).

Index	6064h
Name	position actual value, PL.FB
Object code	VAR
Data type	INTEGER32
Mode	pp, csp
Access	R/W
PDO mapping	possible
Unit	position units
Value range	(-2^{31}) to $(2^{31}-1)$
Default value	—
EEPROM	no

6.8.2.3 Object 6065h: Following error window

The following error window defines a range of tolerated position values symmetrically to the position demand value. A following error might occur when a drive is blocked, unreachable profile velocity occurs, or at wrong closed loop coefficients. If the value of the following error window is 0, the following control is switched off.

Index	6065h
Name	Following error window
Object code	VAR
Data type	UNSIGNED32
Category	optional
Access	R/W
PDO mapping	not possible
Value range	UNSIGNED32
Default value	0

6.8.2.4 Object 60F4h: Following error actual value (DS402)

This object returns the current value of the following error in units defined by the user.

Index	60F4h
Name	Following error actual value
Object code	VAR
Data type	Integer32
Category	optional
Access	R/O
PDO mapping	possible
Value range	INTEGER32
Default value	0

6.8.2.5 Object 60FCh: Position demand internal value (DS402)

This object provides the output of the trajectory generator in position modes. The value is consistent in scaling to the actual internal position value (6063h) and the first setpoint in object 60C1h.

Index	60FCh
Name	Position demand internal value
Object code	VAR
Data type	INTEGER32
Category	optional
Access	R/O
PDO mapping	possible
Value range	INTEGER32
Default value	0

6.9 Interpolated Position Mode (ip) (DS402)

6.9.1 General information

The interpolated position mode is implemented in a simple, straightforward way. Single position setpoints must be transmitted in the interpolation time period and are taken over on every defined SYNC - telegram sent. A linear interpolation is used between the setpoints. Examples can be found from page → p. 174.

6.9.1.1 Objects defined in this section

Index	Object	Name	Type	Access
60C0h	VAR	Interpolation sub mode select	INTEGER16	R/W
60C1h	ARRAY	Interpolation data record	INTEGER32	R/W
60C2h	RECORD	Interpolation time period	Interpolation time period	R/W
60C4h	RECORD	Interpolation data configuration record	Interpolation data configuration record	R/W

6.9.2 Object description

6.9.2.1 Object 60C0h: Interpolation sub mode select

In the AKD, linear interpolation between position setpoints is supported.

Index	60C0h
Name	Interpolation sub mode select
Object code	VAR
Data type	INTEGER16
Category	optional
Access	R/W
PDO mapping	not possible
Value range	0
Default value	0

Value description

Value(decimal)	Description
0	Linear interpolation with a constant time.

6.9.2.2 Object 60C1h: Interpolation data record

In the AKD, a single setpoint (target position, Subindex 1) is supported for the linear interpolation. After the last item of an interpolation data record is written to the devices input buffer, the buffer pointer is automatically incremented to the next buffer.

Index	60C1h
Name	Interpolation data record
Object code	ARRAY
Data type	INTEGER32
Category	optional
Subindex	0
Description	highest sub-index supported
Data type	UNSIGNED8
Category	mandatory
Access	R/O
PDO mapping	not possible
Value range	1
Default value	1
Subindex	1
Description	Interpolation target position in counts, the first parameter of interpolation function
Category	mandatory
Access	R/W
PDO mapping	possible
Value range	INTEGER32
Default value	no

NOTE

A set-point value of the Interpolation data record is only taken, if beside the state machine state "Operation Enable" also the bit 4 of the DS402 controlword (Enable Interpolation, see "Object 6040h: Control word (DS402)" (→ p. 94)) is set.

6.9.2.3 Object 60C2h: Interpolation time period

The interpolation time period is used for the PLL (phase locked loop) synchronized position modes. The unit (subindex 1) of the time is given in $10^{\text{interpolation time index}}$ seconds. Only multiples of 1 ms are allowed. The two values define the internal AKD parameter FBUS.SAMPLEPERIOD (given in multiples of 62.5 Mikroseconds). Both values must be written to set a new interpolation time period. FBUS.SAMPLEPERIOD will only be updated then.

Index	60C2h

6.10 Homing Mode (hm) (DS402)

6.10.1 General information

This section describes the various parameters which are required to define a homing mode.

6.10.1.1 Objects that are defined in this section

Index	Object	Name	Type	Access
607Ch	VAR	HOME.P: home offset	INTEGER32	R/W
6098h	VAR	HOME.MODE, HOME.DIR: homing method	INTEGER8	R/W
6099h	ARRAY	HOME.V: homing speeds	UNSIGNED32	R/W
609Ah	VAR	HOME.ACC, HOME.DEC: homing accel./decel.	UNSIGNED32	R/W

6.10.1.2 Objects that are defined in other sections

Index	Object	Name	Type	Section
6040h	VAR	control word	INTEGER16	dc (→ p. 94)
6041h	VAR	status word	UNSIGNED16	dc (→ p. 95)

6.10.2 Object Description

6.10.2.1 Object 607Ch: Homing offset (DS402)

The reference offset (home offset) is the difference between the zero position for the application and the zero point of the machine. All subsequent absolute motion tasks take account of the reference offset.

Index	607Ch
Name	home offset, HOME.P
Object code	VAR
Data type	INTEGER32
Mode	hm
Access	R/W
PDO mapping	not possible
Unit	user-defined
Value range	(-2^{31}) to $(2^{31}-1)$
Default value	0

6.10.2.2 Object 6098h: Homing method (DS402)

Index	6098h
Name	homing method, HOME.MODE, HOME.DIR
Object code	VAR
Data type	INTEGER8
Mode	hm
Access	R/W

Unit	position units
Value range	-128 to 127
Default value	0

Description of the homing methods

Choosing a homing method by writing a value to homing method (Object 6098h) will clearly establish:

- the homing signal (P-Stop, N-Stop, reference switch)
- the direction of actuation

and where appropriate

- the position of the index pulse.

The reference position is give by the reference offset (Object 607Ch).

A detailed description of the types of homing movement can be found in the description of WorkBench.

The following homing methods are supported:

Method as per DS402	Brief description: Homing	command
-128 to -8	reserved	—
-7	find home input in negative direction, then find next feedback zero	HOME.MODE=18, HOME.DIR=0
-6	find home input in positive direction, then find next feedback zero	HOME.MODE=18, HOME.DIR = 1
-5	set reference point at actual position and store value in NVRAM	HOME.MODE=17, HOME.DIR not changed
-4	find reference switch with fast velocity (6099h sub1) and home on reference switch with low velocity (6099h sub 2), positive count direction	HOME.MODE=16, HOME.DIR=0
-3	find reference switch with fast velocity (6099h sub 1) and home on reference switch with low velocity (6099h sub 2), negative count direction	HOME.MODE=16, HOME.DIR=0
-2	home to mechanical limit, positive count direction	HOME.MODE = 8, HOME.DIR = 1
-1	home to mechanical limit, negative count direction	HOME.MODE = 8, HOME.DIR = 0
0	reserved	—
1	homing to negative limit switch, with zeroing, negative count direction	HOME.MODE=2, HOME.DIR=0
2	homing to positive limit switch, with zeroing, positive count direction	HOME.MODE=2, HOME.DIR=1
3 to 7	not supported	—

Method as per DS402	Brief description: Homing	command
8	homing to reference switch, with zeroing, positive count direction	HOME.MODE=5, HOME.DIR=1
9 to 11	not supported	—
12	homing to reference switch, with zeroing, negative count direction	HOME.MODE=5, HOME.DIR=0
13 to 14	not supported	—
15 to 16	reserved	—
17	homing to negative limit switch, without zeroing, negative count direction	HOME.MODE=1, HOME.DIR=0
18	homing to negative limit switch, without zeroing, positive count direction	HOME.MODE=1, HOME.DIR=1
19 to 23	not supported	—
24	homing to reference switch, without zeroing, positive count direction	HOME.MODE=4, HOME.DIR=1
25 to 27	not supported	—
28	homing to reference switch, without zeroing, negative count direction	HOME.MODE=4, HOME.DIR=0
29 to 30	not supported	—
31 to 32	reserved	—
33	homing within a single turn, negative count direction. If the feedback has an index pulse, HOME.MODE 11 will be used.	HOME.MODE=7,11 HOME.DIR=0
34	homing within a single turn, positive count direction. If the feedback has an index pulse, HOME.MODE 11 will be used.	HOME.MODE=7,11 HOME.DIR=1
35	set reference point at present position	HOME.MODE=0, HOME.DIR=0
36 to 127	reserved	—

6.10.2.3 Object 6099h: Homing speeds (DS402)

Index	6099h
Name	homing speeds
Object code	ARRAY
Data type	UNSIGNED32
Subindex	1
Description	speed during search for switch, HOME.V
Mode	hm
Access	R/W
PDO mapping	not possible
Unit	velocity units
Value range	0 to (2 ³² -1)
Default value	equivalent 60 rpm
Subindex	2
Description	speed during search for zero, HOME.FEEDRATE
Mode	hm

Access	R/W
PDO mapping	not possible
Unit	velocity units
Value range	0 to $(2^{32}-1)$
Default value	50% of Object 6099 sub 1

6.10.2.4 Object 609Ah: Homing acceleration (DS402)

Index	609Ah
Name	homing acceleration
Object code	VAR
Data type	UNSIGNED32
Mode	hm
Access	R/W
PDO mapping	not possible
Unit	acceleration units
Value range	0 to $(2^{32}-1)$
Default value	0

6.10.2.5 Homing Mode Sequence

The homing movement is started by setting Bit 4 (positive edge). The successful conclusion is indicated by Bit 12 in the status word (" Object 6041h: Status word (DS402)" (→ p. 95)). Bit 13 indicates that an error occurred during the homing movement. In this case, the error code must be evaluated (error register: " Object 1001h: Error register (DS301)" (→ p. 47), " Object 1003h: Predefined Error Field (DS301)" (→ p. 49), manufacturer status: " Object 1002h: Manufacturer Status Register (DS301)" (→ p. 48)).

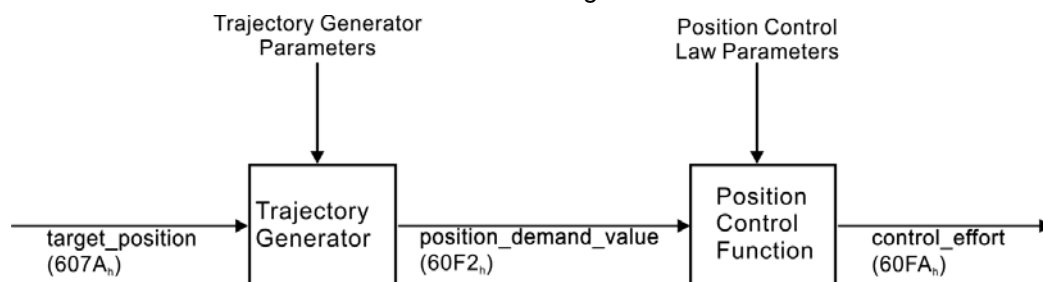

Bit 4	Meaning
0	homing inactive
0 => 1	start homing movement
1	homing active
1 => 0	interruption of homing movement

Bit 13	Bit 12	Meaning
0	0	reference point not set, or homing movement not yet finished
0	1	reference point set, homing movement finished
1	0	homing movement could not be successfully concluded (lag error)
1	1	impermissible state

6.11 Profile Position Mode (DS402)

6.11.1 General Information

The overall structure for this mode is shown in this figure:

The special handshake procedure for the control word and status word is described in "Functional Description" (→ p. 130)

6.11.1.1 Objects that are defined in this section

6.11.2 Object Description

6.11.2.1 Object 2080h: Motion Task Select

This parameter can be used to select a motion task to be executed in profile position mode. The selected task will be started on a rising edge of Bit 4 (new_setpoint) of the DS402 control word "Object 6040h: Control word (DS402)" (→ p. 94) with Bit 5 (change_set_immediately) set.

Index	2080h
Name	Motion Task Select
Object code	VAR
Data type	INTEGER16
Category	optional

Access	WO
PDO mapping	possible
Value range	0 to 128
Default value	0

6.11.2.2 Object 2081h: Active Motion Task

This parameter can be used to read the number of the active motion task. If no task is currently active, this will return the last active motion task number.

Index	2081h
Name	Active Motion Task
Object code	VAR
Data type	INTEGER16
Category	optional

Access	RO
PDO mapping	possible
Value range	INTEGER16
Default value	0

6.11.2.3 Object 607Ah: Target position (DS402)

The object target position defines the target position for the drive. The target position is interpreted as a relative distance or an absolute position, depending on Bit 6 of the control word. The type of relative movement can be further defined by the manufacturer-specific parameter 35B9h Subindex 0. Other properties like following motion tasks can be set with this object as well. The mechanical resolution is set via the scaling objects 6091h and 6092h.

Index	607Ah
Name	target position, MT.P
Object code	VAR
Data type	INTEGER32
Mode	pp, csp
Access	R/W
PDO mapping	possible
Unit	user-defined
Value range	$-(2^{31}-1)$ to $(2^{31}-1)$
Default value	—

6.11.2.4 Object 607Dh: Software position limit (DS402)

Software position limit contains the sub-parameters min position limit and max position limit. New target positions are checked against these limits. The limits are relative to the machine home position, which is the result of homing (including the home offset (Object 607Ch)). As default the software position limits are switched off. Changed values must be saved and the drive must be restarted to take enable the new the software limits.

Index	607Dh
Name	Software position limit, SWLS.LIMIT0

Value range	INTEGER32
Default value	0 (switched off)

6.11.2.5 Object 6081h: Profile velocity (DS402)

The profile velocity is the final velocity that should be reached after the acceleration phase of a motion task. It is scaled in user-defined position units per second. The position units are scaled via the objects "6091h" (→ p. 157) and "6092h" (→ p. 157) (with FBUS.PARAMOS05 = 16).

Index	6081h
Name	profile velocity, MT.V
Object code	VAR
Data type	UNSIGNED32
Mode	pp
Access	R/W
PDO mapping	possible
Unit	speed units
Value range	0 to $(2^{32}-1)$
Default value	10

6.11.2.6 Object 6083h: Profile acceleration (DS402)

The acceleration ramp (profile acceleration) is given in units that are defined by the user (position units per s^2). The position units are scaled via the objects 6091 and 6092. This object is connected to the AKD-parameter DRV.ACC in the Profile Velocity Mode and to the motion task parameter MT.ACC in all other modes.

Index	6083h
Name	profile acceleration, MT.ACC (DRV.ACC in Profile Velocity Mode)
Object code	VAR
Data type	UNSIGNED32
Mode	pp, pv
Access	R/W

Data type	UNSIGNED32
Mode	pp, pv
Access	R/W
PDO mapping	possible
Unit	deceleration units
Value range	0 to $(2^{32}-1)$
Default value	0

6.11.2.8 Functional Description

Two different ways to apply target positions to a drive are supported by this device profile.

Set of setpoints:

After reaching the target_position, the drive device immediately processes the next target position, which results in a move where the velocity of the drive normally is not reduced to zero after achieving a setpoint. With AKD, this is only possible if trapezoidal ramps are used.

Single setpoints:

After reaching the target_position, the drive device signals this status to a host computer and then receives a new setpoint. After reaching a target_position, the velocity is normally reduced to zero before starting a move to the next setpoint.

The two modes are controlled by the timing of the bits for new_setpoint and change_set_immediately in the control word, and setpoint_acknowledge in the status word. These bits allow the setting up of a request-response mechanism in order to prepare a set of setpoints while another set is still being processed in the drive unit. This minimizes reaction times within a control program on a host computer.

The figures show the difference between the set_of_setpoints mode and the single setpoint mode. The initial status of the bit change_set_immediately in the control word determines which mode is used. To keep these examples simple, only trapezoidal moves are used.

If the bit change_set_immediately is "0" a single setpoint is expected by the drive (1). After data is applied to the drive, a host signals that the data is valid by changing the bit new_setpoint to "1" in the control word (2). The drive responds with setpoint_acknowledge set to "1" in the status word (3) after it has recognized and buffered the new valid data. Now the host can release new_setpoint (4) and subsequently the drive will signal through setpoint_acknowledge = "0" its ability to accept new data again (5).

In the figure below this mechanism results in a velocity of zero after ramping down to reach a target_position X1 at t1. After signaling to the host, that the setpoint has been reached as described above, the next target_position is processed at t2 and reached at t3.

With change_set_immediately set to "1" (6), the host instructs the drive to apply a new setpoint immediately after reaching the previous one. The relative timing of the other signals is unchanged. This behavior causes the drive to process the next setpoint X2 in advance, and to hold its velocity when it reaches the target_position X1 at t1. The drive then moves immediately to the next target_position X2 that has already been calculated.

Bits in the control word:		Bits in the status word:	
Bit 4	new_setpoint (positive edge!)	Bit 12	setpoint acknowledge
Bit 5	change_set_immediately	Bit 13	lag/following error
Bit 6	absolute/relative		

Notes on motion task type relative:

If Bit 6 is set, then the motion task type is relative, and activated according to the last target position or actual position. If other types of relative motion are required, these must be activated in advance through the manufacture specific object 35B9h Subindex 0 (MT.CNTL).

Notes on profile position mode:

Functional description for the profile position mode

The drive profile DS402 distinguishes between two methods of moving to a target position. These two methods are controlled by the bits for new_setpoint and change_set_immediately in the control word, and setpoint_acknowledge in the status word. These bits can be used to prepare a motion task while another is still being carried out (handshake).

Moving to several target positions without an intermediate halt

After the target position has been reached, the drive moves immediately to the next target position. This requires that new setpoints are signaled to the drive. This is done through a positive transition of the new_setpoint bit. In this case, the setpoint_acknowledge bit must not be active (=1) in the status word (see also Handshake DS402).

The velocity is not reduced to zero when the first setpoint is reached.

Moving to a single target position

The drive moves to the target position, whereby the velocity is reduced to zero. Reaching the target position is signaled by the bit for target_reached in the status word.

6.11.2.9 Object 60B1h: Velocity Offset

This object provides the offset of the velocity value in cyclic synchronous position mode.

The velocity offset is based on [VL.BUSFF](#).

For FBUS.PARAM05 Bit 4 is 0:

- PDO unit is [RPM]
- SDO unit is [RPM] per default. The SDO unit can also be influenced by changing [UNIT.VROTARY](#) or [UNIT.VLINEAR](#).

For FBUS.PARAM05 Bit 4 is 1:

The PV scaling factor via object 204Ch is used in addition to the raw units [RPM].

NOTE

The final feedforward value that is applied to the [VL.CMD](#) is calculated by $VL.BUSFF * VL.KBUSFF / 4$. The factor 1/4 needs to be taken into account when using the velocity offset.

Index	60B1h
Name	Velocity Offset
Object code	VAR
Data type	INTEGER32
Category	optional
Access	R/W
PDO mapping	possible
Value range	INTEGER32
Default value	0

6.11.2.10 Object 60B2h: Torque Offset

This object (IL.BUSFF) provides the offset of the commanded torque from a bus network connected to the drive. Scaling is 1/1000 of rated torque.

Index	60B2h
Name	Torque Offset
Object code	VAR
Data type	INTEGER16
Category	optional
Access	R/O
PDO mapping	possible
Value range	INTEGER16
Default value	0

7 Appendix

7.1 CANopen Object Dictionary

The following tables describe all objects reachable via SDO or PDO. (i.p. = in preparation).

Abbreviations:

U	= UNSIGNED	RO	= Read only
INT	= INTEGER	RW	= Read and Write
VisStr	= Visible String	WO	= Write only
		const	= Constant

7.1.1 Float Scaling

The scaling applied to objects which match floating-point parameters in WorkBench/Telnet are listed in the column "Float Scaling."

For example, index 607Ah is listed as 1:1 - this means that commanding a value of 1000 in SDO 607Ah is equivalent to entering MT.P 1000.000 in WorkBench. On the other hand, index 3598h is listed as 1000:1 - this means that commanding a value of 1000 in SDO 3598h is equivalent to entering IL.KP 1.000 in WorkBench.

A few parameters are listed as variable (var), because the scaling depends on other settings.

7.1.2 Effectiveness of PDO set-points

Some objects are having effect only in the state machine state "Operation Enabled", which is controlled by the DS402 control word. They are marked with an asterisk (*) at the PDO mapping.

7.2 Examples

7.2.1 Examples, setup

All examples are valid for the AKD. All values are hexadecimal.

7.2.1.1 Basic testing of the connection to the AKD controls

When the AKD is switched on, a boot-up message is transmitted over the bus. The telegram continues to be transmitted, as long as it has not yet found a suitable receiver in the bus system.

If a CAN master is unable to recognize this message, then the following measures can be taken to test communication:

- Check the bus cable: correct characteristic impedance, correct termination resistors at both ends?
- With a multimeter: check the quiescent level of the bus cables CAN-H and CAN-L against CAN-GND (approx. 2.5 V).
- With an oscilloscope: check the output signals on CAN-H and CAN-L at the AKD. Are signals being transmitted on the bus? The voltage difference between CAN-H and CAN-L for a logical "0" is approx. 2-3 V.
- Does signal transmission stop if the master is connected?
- Check the master hardware.
- Check the master software!

7.2.1.2 Example: Operating the State Machine

NOTE

The state machine must be used sequentially during boot-up period. Leaving out a state (except for state "switched on") is not possible.

When the AKD is switched on and the boot-up message has been detected, communication via SDOs can be initiated. For example: all the parameters can be read out or written to, or the state machine for the drive can be controlled.

The state of the state machine can be obtained through the query of Object 6041h Sub 0.

Directly after switch-on, a value will be returned, such as 0240h. This corresponds to the status "Switch on disabled".

The following data would then be visible on the CAN bus:

COB ID	Control byte	Index		Sub-index	Data	Comment
		LSB	MSB			
603	40	41	60	00h	40 00 00 00	
583	4B	41	60	00h	40 02 00 00	response telegram
	2 bytes of data				status	

If the supply power is present and the hardware enable is at the High level (24 V to DGND) then you can try to switch the drive to the state "Switched on" by writing the Control word (Object 6040 Sub 0). If this is successful, there will be a positive acknowledgement in the SDO reply (control byte 0 in the data field = 60h).

Switch on

The messages then appear as follows:

COB ID	Control byte	Index		Sub-index	Data	Comment
		LSB	MSB			
603	2B	40	60	00h	06 00 00 00	Shut down
583	60	40	60	00h	00 00 00 00	response telegram
603	2B	40	60	00h	07 00 00 00	Switch on
583	60	40	60	00h	00 00 00 00	response telegram

control word = 0x0007 meaning:
 Bit 0, Bit 1, Bit 2 set => Switch On,
 Disable Voltage off, Quick Stop off

Status query 2

The new status can then be queried again, and returns the following result:

COB ID	Control byte	Index		Sub-index	Data	Comment
		LSB	MSB			
603	40	41	60	00h	—	query status
583	4B	41	60	00h	33 02 00 00	response telegram

Status = 0x0233 meaning:
 Bit 0, Bit 1, Bit 5 set => ready to Switch On,
 Bit 9 set => remote, operation possible via RS232

7.2.1.3 Example: Jog Mode via SDO

The motor shall work with constant velocity.

COB ID	Control byte	Index		Sub-index	Data	Comment

7.2.1.7 Example: Homing via SDO

When the AKD is operated as a linear axis, a reference/homing point must be defined before positioning tasks can be executed. This must be done by executing a homing run in the Homing mode (0x6).

This example shows the procedure in the Homing mode.

Now some of the parameters that affect the homing movement are set via the bus. If you can be absolutely certain that no-one has altered the parameters in the servoamplifier, then this part can be omitted, since the servoamplifier save the data in non-volatile memory. The inputs must be configured as limit switches.

Because the dimension parameters are not finally defined in DS402, you must select these units:

UNIT.PROTARY = 3

UNIT.VROTARY = 3

UNIT.ACCROTARY = 3

The basic setup of the servoamplifier must be done with the help of the setup software before starting the homing run. The resolution has been set to 10000 $\mu\text{m}/\text{turn}$ in this example.

603	40	41	60	00h	00 00 00 00	read profile status
583	4B	41	60	00h	37 02 00 00	response telegram
603	2B	40	60	00h	1F 00 00 00	Homing_operation_start
583	60	40	60	00h	00 00 00 00	response telegram
603	40	41	60	00h	00 00 00 00	read profile status
583	4B	41	60	00h	37 02 00 00	response: homing not finished
603	40	41	60	00h	00 00 00 00	read profile status
583	4B	41	60	00h	37 16 00 00	response:homing finished

Bit 12 in SDO 6041 indicates, whether homing is finished. Reading of the profile status is not necessary.

7.2.1.8 Example: Using the Profile Position Mode

This example shows the operation of the Profile position mode. The PDOs are set as follows:

First RPDO

No special mapping necessary, because the default mapping enters the controlword RXPDO1.

Second RPDO

Emergency-Object

If, for instance, the resolver connector is disconnected, a serious error will be caused in the controller. This results in an Emergency telegram.

COB	Emergency error		Error register		
	Low	High			
081	10	43	08	00 00 00 00	motor temperature, temperature, manufacturer specific
081	00	00	88	00 00 00 00	response telegram

7.2.1.11 Some aspects of the Compare functionality

The AKD Position Compare feature allows the drive's digital outputs to be turned on or off depending on one or more feedback positions. The AKD supports two independent compare engines (CMP0, CMP1).

The position scaling of position related Compare commands (CMPx.SETPOINT, CMPx.WIDTH, CMPx.MODVALUE, CMPx.MODBOUND1/2) depends on the setting of CMPx.SOURCE.

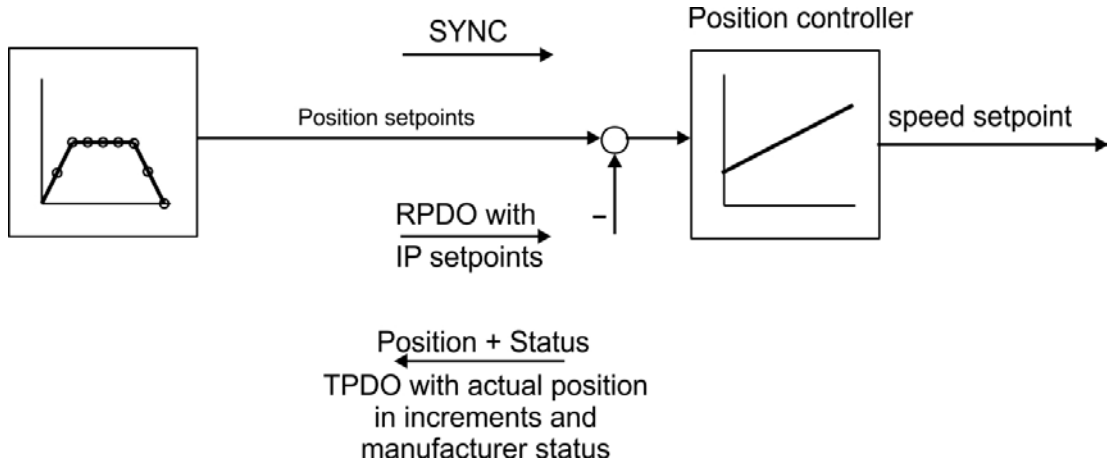

CMPx.SOURCE	Used position scaling
0 = FB1	The compare position values are scaled like FB1.P (object 60E4h sub 1) via the 1st additional gear ratio and feed constant (objects 60E9h, 60EEh, 60EDh, 60E8h).
1 = FB2	The compare position values are scaled like FB2.P (object 60E4h sub2) via the 2nd additional gear ratio and feed constant (objects 60E9h, 60EEh, 60EDh, 60E8h sub 2).
2 = FB3	The compare position values are scaled like FB3.P (object 60E4h sub3) via the 3rd additional gear ratio and feed constant (objects 60E9h, 60EEh, 60EDh, 60E8h sub 3).
3 = PL	The compare position values are scaled like PL.FB (object 60E4h sub 0) via the gear ratio and feed constant (objects 6091h sub 1 and 2, 6092h sub 1 and 2).

7.2.2 Examples, special applications

7.2.2.1 Example: External Trajectory with Interpolated Position Mode

This example shows the possible application for giving two axes position setpoints within one PDO.

Controller structure for the position controller within the drive:

All data are hexadecimal. In the example, the two axes in the system have the station addresses 1 and 2.

Before you begin this procedure, the axes should be homed (just for this example).

The common PDO contains 2 IP (interpolated position) – setpoints and can be transmitted simultaneously to two stations, whereby each station can extract the relevant data. The other data can be made ignored by using dummy entries (Object 2100 sub 0). For this purpose both axes must react on the same RPDO-COB-ID.

Action

Do the RPDO2-mapping for both axis:

Axis 1:

COB	Control	Index		Sub-	Data	Comment
ID	byte	LSB	MSB	index		
601	23	01	14	01h	01 03 00 C0	disable RPDO2
581	60	01	14	01h	00 00 00 00	response telegram
601	2F	01	16	00h	00 00 00 00	RPDO2: delete mapping
581	60	01	16	00h	00 00 00 00	response telegram
601	23	01	16	01h	20 01 C1 60	RPDO2, entry 1: IP setpoint axis 1

581	60	01	18	01h	00 00 00 00	response telegram
601	2F	01	1A	00h	00 00 00 00	TPDO2: delete mapping
581	60	01	1A	00h	00 00 00 00	response telegram
601	23	01	1A	01h	20 00 63 60	TPDO2, entry 1: actual position (increments)
581	60	01	1A	01h	00 00 00 00	response telegram
601	23	01	1A	02h	20 00 02 10	TPDO2, entry 2: Dummy entry 4 bytes
581	60	01	1A	02h	00 00 00 00	response telegram
601	2F	01	1A	00h	02 00 00 00	TPDO2, enter number of mapped objects
581	60	01	1A	00h	00 00 00 00	response telegram
601	23	01	18	01h	81 03 00 00	enable TPDO2
581	60	01	18	01h	00 00 00 00	response telegram

The same must be done for axis 2.

Here it is assumed that both drives accept new trajectory values with every SYNC command, and must return their incremental position and manufacturer status values. The communication parameters must be set accordingly.

Axis 1:

COB	Control	Index		Sub-	Data	Comment
ID	byte	LSB	MSB	index		
601	2F	01	14	02h	01 00 00 00	RPDO2 axis 1, reaction on every sync
581	60	01	14	02h	00 00 00 00	response telegram
602	2F	01	14	02h	01 00 00 00	RPDO2 axis 2, reaction on every sync
582	60	01	14	02h	00 00 00 00	response telegram
601	2F	01	18	02h	01 00 00 00	TPDO2 axis 1, reaction on every sync
581	60	01	18	02h	00 00 00 00	response telegram
602	2F	01	18	02h	01 00 00 00	TPDO2 axis 2, reaction on every sync
582	60	01	18	02h	00 00 00 00	response telegram

The other Tx-PDOs 3 and 4 should be switched off to minimize bus-load:

COB	Control	Index		Sub-	Data	Comment
ID	byte	LSB	MSB	index		
601	23	02	18	01h	81 03 00 C0	Switch off TPDO3
581	60	02	18	01h	00 00 00 00	response telegram
601	23	03	18	01h	81 04 00 C0	Switch off TPDO4
581	60	03	18	01h	00 00 00 00	response telegram

The same must be done for axis 2.

In order to be able to make trajectory movements, both drives must be operating in the appropriate mode. This is set through Index 6060h:

COB	Control	Index		Sub-	Data	Comment
ID	byte	LSB	MSB	index		
601	2F	60	60	00h	07 00 00 00	Set IP mode for axis 1
581	60	60	60	00h	00 00 00 00	response telegram
602	2F	60	60	00h	07 00 00 00	Set IP mode for axis 2
582	60	60	60	00h	00 00 00 00	response telegram

The cycle interval for the IP-mode shall be 1 ms. This must be defined with Object 60C1 sub 1 and 2:

COB	Control	Index		Sub-	Data	Comment
ID	byte	LSB	MSB	index		
601	2F	C2	60	01h	01 00 00 00	Interpolation time unit 1
581	60	C2	60	01h	00 00 00 00	response telegram
601	2F	C2	60	02h	FD 00 00 00	Interpolation time index -3 -> Cycle time = $1 * 10^{-3}$ s
581	60	C2	60	02h	00 00 00 00	response telegram

The same must be done for axis 2.

To start up the axes, the drives must be put into the operational status (operation enable) and the network management functions must be started.

The network management functions enable the application of the Process Data Objects (PDOs) and are initialized by the following telegram for both axes:

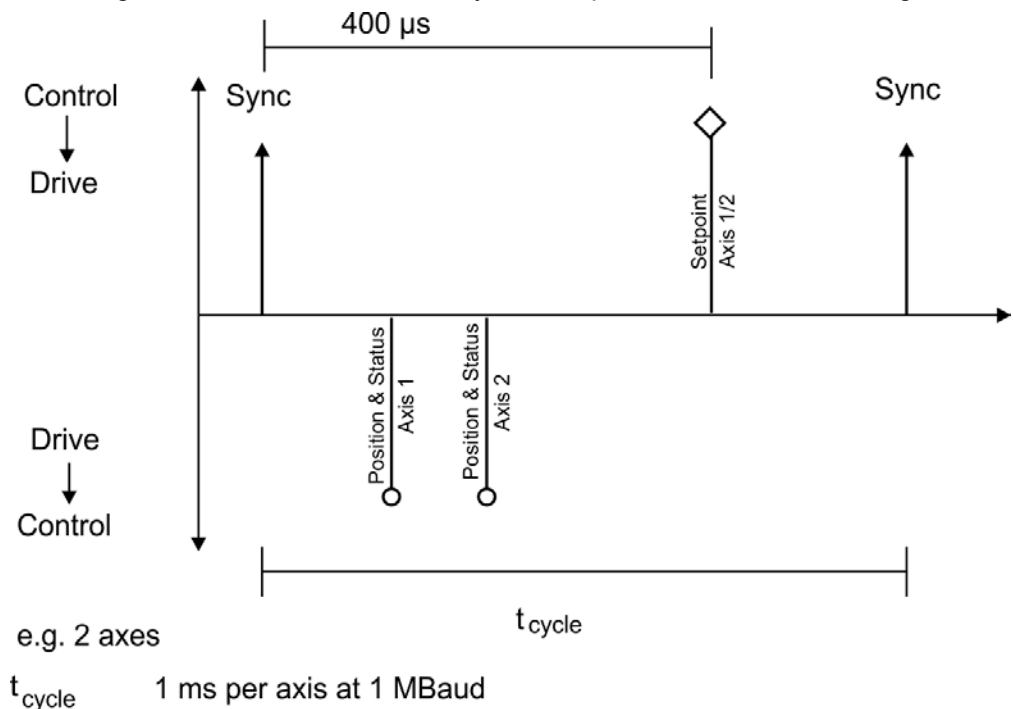

Switch the NMT (Network Management) state machine to operation enable:

COB-ID	Command specifier (CS)	Node-ID	Comment
0	1	1	NMT enable for all axes

Next, power is applied to each drive, and they are put into the operation enable condition. This should be done in steps with waiting for the appropriate reaction of the drive (e.g. axis 1):

COB-ID	Data	Comment
201	06 00	Shutdown command
181	31 02	State Ready_to_switch_on
201	07 00	Switch_on command
181	33 02	State Switched_on
201	0F 00	Enable_operation command
181	37 02	State Operation_enabled
201	1F 00	Enable IP-mode
181	37 12	IP-mode enable

The configuration above now enables a cyclical sequence, as shown in the diagram:

RPDO 2 can now be used to supply trajectory data for both axes, e.g.:

COB-ID	Byte 0	Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7
301	F4	01	00	00	E8	03	00	00

In this example, the first axis receives a trajectory value of 500 increments (Bytes 0 to 3) and the second axis receives a trajectory value of 1000 increments.

The axes accept these values, and the positioning is made when the next SYNC telegram is received.

SYNC telegram

COB-ID
080

Afterwards, both axes send back their incremental positions and the contents of their status registers when the SYNC Object with the COB-ID for the 2ndTPDO is received.

COB ID	Byte 0	Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7	Comment
181	23	01	00	00	00	00	03	44	position + manufacturer status register for axis 1
182	A5	02	00	00	00	00	03	44	position + manufacturer status register for axis2

If an error occurs during operation, the axis transmits an Emergency message, which could appear like this:

Emergency Object

COB ID	Emergency error		Error register	Category		
	Low	High				
081	10	43	08	01	00 00 00 00	motor temperature, temperature, manufacturer-specific
081	00	00	08	00	00 00 00 00	response telegram

9 Record of Document Revisions

Revision	Remarks
- , 11/2009	Beta launch version
- , 12/2009	Objects 2018&60FE added, Object dictionary, formatting updated
A, 04/2010	Termination connector "optional", several new objects, Object dictionary split
B, 07/2010	Part number added, several new objects, object dictionary expanded
C, 01/2011	HW Rev. C, new objects, object dictionary expanded
D, 04/2011	Object dictionary updated, baudrate setup
E, 10/2011	Cover layout & error table & object dictionary updated, objects 3474 & 3475 & 3496 & 6091 added
F, 03/2012	Touch Probe objects 60B8 to 60BD & 60D0 added, object 2071 & 2077 added, PVT interpolation added, 60C0 & 60C1 & 60C4 & 6041 bit 9 updated, object dictionary updated, error codes updated, object 1011h added
G, 08/2012	Object dictionary updated, error codes updated
H, 11/2012	Object dictionary updated, error codes updated, new object 345A
J, 05/2013	Objects 2000,2002,60B1,60B2 added, Object dictionary, formatting acc. to 82079
K, 09/2013	Scaling 60FFh, object dictionary updated
L, 12/2013	Error codes extended, object dictionary updated
M, 05/2014	Object 1012 added, object dictionary updated, PVT removed
N, 12/2014	Object 60C2 corrected, object dictionary updated with CMP objects, CMP hints added (see setup examples), examples corrected, object 2011h-2012h-2013h added
P, 11/2015	Object 60C1/60D0/20A4/20A5 updated, objects 605A/60E0/60E1/60FC added, object dictionary updated , mode dependant bits in 6041 added
R, 09/2016	Object 6077 updated, chapter "Important Parameters" updated. Added objects 35B8h, 35BDh, 6087h, 53C7h, 53D5h, 53D6h, 53D7h, 5403h, 5404h, 5405h, and 5406h. Added new homing methods -7 to -5 for Object 6098h.
T, 03/2017	CANopen Emergency Messages and Error Codes (→ p. 41) updated. Added objects 5375h (→ p. 155), "5377h" (→ p. 155), and 5379h (→ p. 155).
U, 10/2017	CANopen Emergency Messages and Error Codes (→ p. 41) updated. Added Cyclic sync velocity mode (csv) and Cyclic sync torque mode (cst) to object 6040h. Added Object 207Fh: Maximum Velocity (→ p. 112). Added objects 541fh and 5420h.
V, 11/2018	Updated warning symbols.
W, 11/2019	Added objects 2080h, 2081h, 3432h. Updated Objects 1002h, 3450h, 542C, 60B1h and FBUS.PARAM05 bits. Corrected bit 11 Statusword.
Y, 10/2020	Added objects 34D1h, 547Ah, 547Bh, edited to data type for objects 2001h and 2012h and update to "Construction of the Communication Object Identifier" (→ p. 27).

About KOLLMORGEN

Kollmorgen is a leading provider of motion systems and components for machine builders. Through world-class knowledge in motion, industry-leading quality and deep expertise in linking and integrating standard and custom products, Kollmorgen delivers breakthrough solutions that are unmatched in performance, reliability and ease-of-use, giving machine builders an irrefutable marketplace advantage.

Join the [Kollmorgen Developer Network](#) for product support. Ask the community questions, search the knowledge base for answers, get downloads, and suggest improvements.
